Dear Sir:

There have been occasions in our Refinery when your fire-resistant hydraulic fluid Pyraul F-9 has come in cantact with molten copper (2100°F). This has been caused by accidental spillage and damages that occur on equipment adjacent to the molten copper.

Several of our supervisors have made inquiries regarding the vapors that arise whenever Pydraul comes in contact with the molten copper. They wish to know is the vapors are harmful to workmen.

Any information you may have regarding this industrial hygiene problem will be appreciated.

Sincerely yours,

E. W. Wood

E. W. Wood
