OPERATING DEPARTMENT AIR QUALITY MONITORING

As you are aware, the Du Pont Company is active in a number of epidemiological studies at plant sites and research laboratories. Many of these studies involve sampling of the air environment at such plant locations and physical examinations of employees over varying periods of time in order to determine exposure levels and the effect, if any, that plant air quality has on the health of employees. Based on our experience when we initiated asbestos sampling approximately 10 years ago, we can expect a number of inquiries from contractor employees, business agents, and other interested parties as to the intent of the air sampling. In response to a valid request, we should state that:

"The air sampling is part of Du Pont's on-going safety program to insure a safe working environment for Du Pont employees as well as the employees of any business invitees, such as outside

contractors working at Du Pont locations. Air sampling is a routine measurement to determine that air quality continues at desired levels. Notification of all health or safety hazards will be given to all contractors on Du Pont locations when it is determined that any unsafe or hazardous conditions exist. Precautionary measures, such as protective equipment required to perform work in an area where it is established that a hazard exists, will be specified at the same time."

Rather than providing this information for general consumption, I would propose that this explanation be given only as a response to a valid request for information.
