7.2 After sampling, prior to removing the test specimen, it is mandatory the sample be shaken or stirred until it is homogeneous and free of any settled material. This is particularly important if there is a delay between sampling the bath and performing this test procedure. The absence of settled material should be ascertained visually or by inserting a spatula and scraping the bottom of the container. Continue to shake or stir the sample until specimens are taken for measurement. *This Point is Very Important.*

8. Procedure

NONVOLATILE CONTENT

8.1 Weigh two aluminum dishes separately, each to 0.1 mg and record as W_1 .

8.2 Using a syringe, withdraw 1.0 to 1.5 of the well mixed sample, then quickly weigh the syringe to 0.1 mg, recording this weight as W_2 . Transfer the entire contents of the syringe into the aluminum dish. Reweigh the empty syringe to 0.1 mg and record as W_3 . In the case of ultrafiltrate clear liquids or of low solids paints, increase the specimen size to 5 mL and preheat at 60°C for 2 h. Duplicate this step with the second aluminum dish (8.1).

8.3 Add a few millilitres of water to the specimen in the aluminum dishes prior to placing them in the oven. This facilitates uniform spreading of the material. Place the dishes in the 110°C oven for 1 h.

8.4 Remove the dishes from the oven and allow to cool to room temperature in a desiccator. Reweigh them to 0.1 mg and record the weights as W_4 .

8.5 Retain the dishes for measurement of inorganic pigment content as detailed in a following section of these test methods.

¹ These test methods are under the jurisdiction of ASTM Committee D-1 on Paint and Related Coating and Materials and are the direct responsibility of Subcommittee D01.21 on Chemical Analysis of Paints and Paint Materials. Current edition approved Dec. 13, 1990. Published January 1991.

² *Annual Book of ASTM Standards*, Vols 06.03 and 11.01.

³ *Annual Book of ASTM Standards*, Vol 06.01.

⁴ *Annual Book of ASTM Standards*, Vol 15.05.

9. Calculation

9.1 Calculate the percent nonvolatile content as follows:

$$\% NV = \frac{W_4 - W_1}{W_2 - W_3} \times 100$$

where:

- W_1 = weight of empty aluminum dish, g,
 W_2 = weight of syringe filled with sample, g,
 W_3 = weight of empty syringe, g, and
 W_4 = weight of dish and contents after 1 h at 110°C, g.

10. Precision and Bias

10.1 Precision is based on an interlaboratory study in which the operators in each of ten laboratories analyzed in duplicate on 2 days, four different electrocoat-bath samples with nonvolatile contents ranging from 0.30 to 25.2 %. The results were analyzed statistically in accordance with Practice E 180. The interlaboratory coefficient of variance was 1.6 % at 30 df and the interlaboratory coefficient of variation was 2.3 % at 27 df. Based on these coefficients, the following criteria should be used for judging the acceptability of results at the 95 % confidence level:

10.1.1 *Repeatability*: Two results, each the mean of duplicate determinations obtained by the same operator on different days, should be considered suspect if they differ by more than 4.6 % relative.

10.1.2 *Reproducibility*: Two results, each the mean of duplicate determinations obtained by operators in different laboratories, should be considered suspect if they differ by more than 6.7 % relative.

10.2 No bias has been determined for this test method.

11. Procedure

INORGANIC PIGMENT CONTENT

11.1 Place the weighing dishes used for the nonvolatile content determination in the muffle furnace at 500°C for 2 h.

11.2 After 2 h, remove the dishes from the muffle furnace, transfer them to a dessicator and allow to cool to room temperature. After cooling, remove dishes and weigh to 0.1 mg, recording these weights at W_5 .

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 1916 Race St., Philadelphia, PA 19103.

NOTE 1—If an organic char is still present in the aluminum dish after 2 h in the muffle furnace, continue heating in the furnace until no char is present.

12. Calculation

12.1 Calculate the percent inorganic pigment as follows:

$$\% \text{ Inorganic Pigment (EC Bath)} = \frac{W_5 - W_1}{W_2 - W_3} \times 100$$

where:

- W_1 = weight of empty aluminum dish, g,
 W_2 = weight of syringe filled with sample, g,
 W_3 = weight of empty syringe, g, and
 W_4 = weight of aluminum dish and contents after heating in muffle furnace, g.

13. Precision and Bias

13.1 Precision estimates are based on an interlaboratory study in which the operators in ten different laboratories analyzed in duplicate on 2 days, four electrocoat bath materials containing inorganic pigment content ranging from 0.17 to 4.52 weight %. The results were analyzed statistically in accordance with Practice E 180. The intralaboratory coefficient of variation was 2.2 % relative at 40 df and the interlaboratory coefficient of variation was 10.8 % at 36 df. Based on these coefficients, the following criteria should be used for judging the acceptability of results at the 95 % confidence level:

13.1.1 *Repeatability*: Two results, each the mean of duplicate determinations, obtained by the same operator on different days, should be considered suspect if they differ by more than 6.3 % relative.

13.1.2 *Reproducibility*: Two results, each the mean of duplicate determinations, obtained by operators in different laboratories, should be considered suspect if they differ by more than 31.1 % relative.

13.2 No bias has been determined for this test method.

Standard Guide to Testing Solvent-Borne Architectural Coatings¹

This standard is issued under the fixed designation D 5146; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

Scope

This guide covers the selection and use of procedures for testing solvent-borne coatings to be used on exterior, interior or both types of surfaces (see Note 1). The properties that can be examined or, in some cases, the relevant test procedures are listed in Tables 1 and 2.

NOTE 1—The term "architectural coating" as used here combines the definition in Definitions D 16 with that in the FSCT Paint/Coatings Glossary, as follows: "Organic coatings intended for on-site application to interior or exterior surfaces of residential, commercial, institutional, or industrial buildings, in contrast to industrial coatings. They are protective and decorative finishes applied at ambient temperatures. Often called Trade Sales Coatings." (See 2.3.)

NOTE 2—Architectural coatings that are designed to give better performance than most conventional coatings because they are tougher, more stain- and abrasion-resistant are covered by Guide D 3730.

2 The types of organic coatings covered by this guide are as follows:

- (1) Type 1 Interior Low-Gloss Wall Finish, partly covered by Guide D 3323,
- (2) Type 2 Interior Gloss and Semigloss Wall and Trim Enamels, partly covered by Guide D 3425,
- (3) Type 3 Exterior House and Trim Coatings, now covered by Guide D 2932, and
- (4) Type 4 Floor Enamel, Exterior and/or Interior, now covered by Guide D 3383.

2.1 Each is intended for application by brushing, rolling, spraying, or other means to the materials appropriate for its use, which may include wood, plaster, wallboard, masonry, metal, previously painted surfaces, and other architectural substrates.

3. **Terminology**
3.1 For definitions of terms in this guide refer to Definitions D 16, D 1554 and D 1038 and to the FSCT Paint/Coatings Dictionary.
4. **Conditions Affecting Solvent-Reducible Coatings**
4.1 *Substrate Type*—The substrate to be painted can affect not only the application properties of a coating, such as gloss and uniformity, but is also a factor in determining the type of coating to use. For instance, low-gloss wall finishes do not have the abrasion resistance required on floors, whereas finishes intended only for interior service probably do not have adequate resistance to weather factors. Other factors are the type and quality of wood or wood composite (plywood, particle board or hardboard), the type, quality and alkalinity of concrete, plaster and joint cement systems, and the type and condition of any previous coatings.
4.2 *Substrate Conditions*—Conditions such as porosity, hardness or, in the case of unpainted concrete, alkalinity determine the kind of coating that can be applied. The condition of previously painted substrates, such as degree of chalk, presence of grease, dirt, and mold, film adhesion and porosity, and the general condition of the previous coating, all influence the performance of coatings. Smoothness of the substrate affects the spreading rate, final appearance, and texture.

^B Equivalent only to Method B of D 522.

^C 6271 is not equivalent.

detergent cleaning, solvent cleaning, and sanding.

4.5 Type and quality of primer or undercoat and time of drying before topcoating.

4.6 Environmental conditions such as temperature and humidity at the time of coating application and during drying.

4.7 Environmental conditions after application, both general for the area and specific, such as under eaves, behind shrubbery, northside and southside exposure.

5. Selection of Tests

5.1 Because the conditions to which a coating is subjected vary with (a) the surface type: wall, floor, ceiling, and (b) the

service environment: exterior or interior, specialized types of solvent-borne coatings have been developed for the different locations. The recommended test methods presented in Tables 1 and 2 cover practically all the properties of solvent-reducible coatings but all of them are not required with each type. Coatings intended for exterior use only or both exterior and interior use require certain properties not relevant to those for interior use only. Selection of the methods to be followed must be governed by experience and the requirements in each individual case, together with agreement between the purchaser and the seller.

5.2 The purchaser should first determine the properties a coating should have and then select only those test methods

Method
141

measure or evaluate those properties. After selecting the tests, the purchaser should then decide which properties are the most important and establish the requirements accordingly. Since coating properties frequently tend to oppose each other, such as low sheen versus cleanability, some properties may need to be less emphasized if others are to be accentuated. This balance of properties must be considered when selecting the tests and establishing the requirements. The significance of the tests in the normal range of values are presented in the different sections, in most cases.

This guide does not indicate relative importance of the tests nor does it recommend specific test values. These properties very important to one purchaser may be less so to another.

Sampling

Prior to sampling, the condition of the container should be checked since damage to it may cause evaporation, leaking, or other undesirable effects on the coating.

2. Sample in accordance with Practice D 3925. Determine the density in pounds per gallon (kilograms/litre) in accordance with Test Method D 1475. Continue sampling until determining density until successive results agree within 0.1 lb (45 g) or as agreed upon between the purchaser and supplier. Then take samples for testing.

3. Specify the amount required for a representative sample, the package sizes, and an identification code. A 1 U.S. gal (or 4-L) sample is usually sufficient for the recommended tests, but for guidance in selecting a sampling method consult Practice E 105.

Liquid Coating Properties

1. *Skinning*—Coatings that contain a binder that dries by oxidation may be subject to skin formation in a partially-filled can. Since skins are insoluble in the material they must be removed before use. The referenced test in a partially-filled container indicates the tendency of the material to skin. A typical minimum time for skinning in accordance with this method is 48 h. Examine the original sample for skins, both on and below the surface. Using a well-mixed, skin-free portion of the sample, perform a skinning test in accordance with Guide D 154.

2. *Condition in Container*—Thickening, settling, and separation are undesirable and objectionable if material that has been stored cannot be readily reconditioned and made suitable for application with a reasonable amount of stirring. The referenced method covers procedures for determining changes in properties after storage and lists characteristics that are undesirable and objectionable in a stored paint. Determine condition in the container in accordance with Test Method 3011 of Federal Test Method Standard No. 141. See also 7.13, Package Stability.)

3. *Coarse Particles and Foreign Matter*—Liquid coatings must be free of coarse particles and foreign matter to be able to form uniform films of good appearance, a typical maximum being 0.5 weight % of the total material. The referenced method with a 325-mesh (45- μ m) screen gives the percent of these particles. Determine content of coarse particles and foreign matter in accordance with Test Methods D 185.

7.4 *Density or Weight per Gallon*—The density measured in pounds per gallon (kilograms per litre = g/mL) is used to ensure product uniformity from batch to batch, provides a check against the theoretical weight calculated from the formula, and is useful for determining the similarity of two samples. The referenced method gives a procedure for measuring the density of the coating at a specified temperature. Most interior paints have densities of about 10 to 12 lb/gal (1.2 to 1.4 kg/L). Determine density in accordance with Test Method D 1475, using a calibrated weight per gallon cup.

7.5 *Fineness of Dispersion*—Generally, the more finely a pigment is dispersed, the more efficiently it is being utilized. One method for measuring the degree of dispersion (commonly referred to as "fineness of grind") is to draw the liquid coating down a calibrated tapered groove varying in depth from 4 to 0 mils (100 to 0 μ m) (0–8 Hegman units). The depth at which continuous groupings of particles or agglomerates, or both, protrude through the surface of the wet film is taken as the fineness of dispersion value. Higher readings in Hegman units or lower readings in mils or micrometres indicate finer dispersion. Low sheen finishes may have a dispersion value of 2 mils (50 μ m or 4 Hegman) while gloss enamels might be near zero (8 Hegman) indicating that the pigment agglomerates are too small to be detected by the referenced method. Determine fineness of dispersion in accordance with Test Method D 1210.

7.6 *Consistency (Low-Shear Viscosity)*—Consistency is important, relating to application and flow, and should fall within a stated range for satisfactory reproduction of a specific formula. While consistency is an important property it does not determine the quality of a coating and should be used mainly to ensure product uniformity. In the referenced method, consistency is defined as the load in grams to produce a specified rate of shear. The load value is frequently converted to Krebs units (KU) and the Stormer Consistency reported on that basis. Although the consistency of most solvent-borne house and trim coatings is about 150 to 300 g/100 revolutions (72 to 95 KU), a much wider range is possible because of the great variation that may occur in the rheological properties of these paints. Enamels for professional painters are usually formulated at a higher consistency range than consumer enamels. Typical ranges are 75 to 90 KU for consumer enamels and 90 to 100 for professional painter enamels. Two paints of the same consistency may have quite different rheological properties during application. Determine the consistency in accordance with Test Method D 562.

7.7 *Rheological Properties of Non-Newtonian Materials*—Rheological properties are related to application and flow characteristics of the liquid coating. The referenced methods cover the determination of rheological properties and are particularly suited for coatings that display thixotropic characteristics. They actually measure viscosity under different shear rates. In Test Method D 4287 the rate is similar to that occurring during brush application so that the measured viscosity is related to brush drag, spreading rate and film build. Determine rheological properties in accordance with Test Methods D 2196 or D 4287, or both.

7.8 *Flash Point*—Organic solvents used in these coatings have characteristic temperatures at which they support

types of
different
used in
ties of
quired
only or
ies not
of the
ice and
r with
erties a
ethods

combustion. This temperature is known as the flash point and is often used for danger classification in shipping by common carrier. It is also used to determine conditions of storage to meet fire regulations and the safety requirements of the U.S. Occupational Safety and Health Act (OSHA). Determine flash point in accordance with Test Methods D 93, Part B, or D 3278.

7.9 Odor—Some solvent combinations produce obnoxious odors, particularly when painting indoors with inadequate ventilation and at elevated temperatures. Interior solvent-borne coatings usually contain low-odor or odorless mineral spirits. Nevertheless they should be evaluated to ensure that they are acceptable. Test for odor in accordance with Method 4401 of Federal Test Method Standard No. 141. Although not specifically designed for liquid coatings Test Method D 1296 may be used with the solvent-reducible type.

7.10 Absorption—On porous surfaces, binder penetration can result in pigment volume concentration changes as the film dries. This may cause appearance to vary. The referenced method provides a rough measure of the wetting and penetrating properties of the binder on a porous surface. Determine the absorption in accordance with Method 4421 of Federal Test Method Standard No. 141.

7.11 Colorant Acceptance—Tintability of white bases with colorants of standardized tinting strength is a trade requirement. If tinting colors are not adequately compatible with tint bases, lighter, darker, or nonuniform shades of colors are produced. There is no accepted ASTM test method at present. Test methods may be agreed upon between the purchaser and seller.

7.12 Dilution Stability—Dilution with a specified thinner shows whether the materials are compatible and whether the reduced coating is stable. Consequently the suggested diluent should be readily incorporated into the coating without excessive stirring or shaking. The referenced method evaluates the stability of the material that has been reduced by a given amount or to a specified viscosity. Determine dilution stability in accordance with Method 4203 of Federal Test Method Standard No. 141.

7.13 Package Stability—Since paints cannot normally be used immediately after manufacture, they must remain stable in the can for some time. At normal temperatures most paints can be stored for over a year with little change in properties. Although indications of long term package stability can usually be obtained in several days or weeks at an elevated temperature, such as 122°F (50°C) or 140°F (60°C), occasionally the results of the accelerated test do not agree with those at prolonged normal storage conditions. The referenced method predicts the change in consistency and certain other properties of packaged paint when stored at temperatures above freezing. Determine package stability in accordance with Test Method D 1849.

8. Coating Application and Film Formation

8.1 Application Properties—Application or working properties of a paint are generally compared to a standard or described by requirements in the product specification. Determine working properties in accordance with Method 4541 of Federal Test Method Standard No. 141.

8.1.1 Brush Application—Brushed films should be smooth and free of seeds and on vertical surfaces should

show no sagging, color streaking, or excessive brush marks. Brush drag should not be excessive although some degree of drag may be desirable for adequate film thickness application. Wall finishes are tested on vertical surfaces and floor enamels on horizontal surfaces, although evaluation of the latter on vertical surfaces may be necessary to determine performance on stair risers, railings, posts, etc. The referenced method covers a means for the determination of the brushing properties of a coating. Even though the test is subjective someone experienced in the art can produce quite consistent results, particularly in the evaluation of drag qualities. Determine the brushing properties in accordance with Method 2141 of Federal Test Method Standard No. 141.

8.1.2 Roller Application—Both wall and floor coatings are frequently applied by roller. This type of application tends to produce some stipple pattern. The referenced method covers the evaluation of a material's characteristics when applied by roller. Determine roller coating properties in accordance with Method 2112 of Federal Test Method Standard No. 141.

8.1.2.1 Some coatings spatter more than others when applied by roller. The degree to which a paint spatters when roller applied can be determined by the density of the spatter. In the referenced method a specially designed notched spool is rolled through a film of the test material that has been applied to a plastic panel. Any spatter generated falls upon a catch paper and after drying is rated against photographic standards. This procedure eliminates the influence of the roller cover, thus determining the spattering characteristics of the paint alone. Determine spatter resistance in accordance with Test Method D 4707.

8.1.3 Spray Application—Architectural coatings are sometimes applied by spray. Both air and airless spray are used on commercial work. Determine the spray application properties in accordance with Method 2131 of Federal Test Method Standard No. 141. Manual application is very subjective and should be performed only by an individual skilled in the art of using spray equipment.

8.2 Drying Properties—The drying time of a coating is important in determining when a freshly painted room, floor or stair may be put back in use. Slow drying may result in dirt or insect pickup resulting in a poor appearance or, if on an exterior surface, rain or dew may cause a nonuniform appearance. The drying time of a coating is determined by its composition and by atmospheric conditions during drying. Typical drying times for enamels are ½ to 2 h set-to-touch and 18 h dry hard under normal temperature and humidity conditions. Some coatings lose drying speed during storage in the container. Any of the several methods for determining the various stages of film formation in the drying or curing of organic coatings may be used. For example, if two coats are specified the determination of "dry-to-recoat" time is important. Determine appropriate drying time(s) in accordance with Test Methods D 1640.

8.3 Levelling Properties—Levelling is an important property when smooth, uniform surfaces are to be produced, as it affects hiding and appearance. The referenced method covers the relative levelling characteristics of liquid coatings. Determine levelling in accordance with Test Method D 4062.

8.4 Sag Resistance—Some coatings sag and form curtains

before the film sets. This is an important property particularly for semigloss and gloss enamels because sagging results in unsightly film appearance. Measure sag resistance in accordance with Test Methods D 4400.

8.5 Touch-Up Uniformity—After a paint has dried, areas where less material was applied sometimes become noticeable. If the paint has suitable touch-up properties, additional material can be applied to these areas only, instead of finishing the complete wall. The color, gloss, and levelling of the touched-up areas and the previously coated area should be uniform. Differences in these properties are often caused by short wet-edge time, poor levelling on recoat, and pigment orientation or flotation during and after application. Determine touch-up properties in accordance with Test Method D 3928.

9. Appearance of Dry Film

9.1 Color Differences by Visual Comparison—Visual comparison of colors is fast and often acceptable although numerical values are not obtained. The referenced method covers the spectral, photometric, and geometric characteristics of light source, illuminating and viewing conditions, sizes of specimens, and general procedures to be used in the visual evaluation of color differences of opaque materials relative to their standards. Determine color difference in accordance with Practice D 1729.

9.2 Color Differences Using Instrumental Measurements—The difference in color between a product and its standard can be measured by instrument. Generally the tolerance is agreed upon by the purchaser and seller and may also be required if a product specification is involved. Color measuring instruments provide numerical values that can be compared to subsequent measurements. The referenced method covers the calculation of instrumental determinations of small color differences observable in daylight illumination between nonfluorescent, nonmetameric, opaque surfaces such as coated specimens. If metamerism is suspected, visual evaluation (9.1) should be used to verify the results. Calculate in accordance with Test Method D 2244 the color differences that have been measured instrumentally.

9.3 Directional Reflectance—This property is a measure of the appearance of lightness of a coating. It is usually assigned a value in specifications for white and pastel shades, a typical minimum reflectance value being 86 % for white wall paint. In the referenced method the directions of illumination and viewing are specified so as to eliminate the effect of gloss. Determine daylight directional reflectance in accordance with Test Method E 97.

9.4 Gloss—This property is a measure of the capability of a coating surface to reflect light in a mirror-like (specular) manner, that is, light strikes the surface and is reflected at the equal but opposite angle. In the referenced method the numerical gloss units are the ratio of light reflected by a specimen to that reflected by the primary standard black glass that is assigned a gloss value of 100. The gloss of some coatings varies greatly with the angle of incidence so that a complete description of their gloss would require measurements over a wide range of angle. In practice, the gloss of architectural finishes is adequately characterized by measurements at 60° or 85°, or both, from a line perpendicular (normal) to the surface. The 85° angle is a very low

("grazing") angle (5°) of illuminating and viewing the surface and the gloss at this angle is called "sheen". Attempts to standardize the levels of gloss associated with the several descriptive terms have not been very successful since the gloss scale is continuous with no distinct boundaries. Hence, there is some overlap at the ends of some gloss classifications in common usage.

9.4.1 Gloss, 60°—Semigloss enamels are particularly sensitive to enamel hold-out of primers and undercoats. Low or uneven gloss readings are indicative of this defect. Oil house paints are typically in a 60° gloss range from 30 to 70 while trim enamels are from 70 to 90. Floor enamels generally have a high (90+) gloss reading when first applied but this decreases with time and traffic. Interior semigloss enamels after drying 48 h are typically in the range from 40 to 70 but measurements taken shortly after drying should be repeated after one week because the gloss can drop considerably in the first few days of drying. Determine the 60° gloss in accordance with Test Method D 523.

9.4.2 Sheen (85° Gloss)—Although low-gloss paints with good uniformity of appearance at low angles of viewing often have little sheen while those with good cleansability usually have moderate sheen, this is not always the case so that sheen should not be used as a measure of other paint properties. Most flat wall paints have a sheen of about 1 to 10. The referenced method, using the 85° geometry, is useful in characterizing the low-angle appearance of low-gloss coatings. Determine the sheen (85° gloss) in accordance with Test Method D 523.

NOTE 3—This property is of particular interest with flat to low-gloss finishes.

9.5 Hiding Power—Hiding power is a measure of the ability of a coating to obscure the substrate and is usually expressed as the spreading rate for a specified level of opacity. It is, however, dependent on uniformity of film thickness, which in practical applications is influenced by flow, levelling and application properties of the coating. Test Method D 2805 is precise and gives an absolute rather than a comparative result. Paint is applied with an applicator bar to minimize the effects of flow and levelling, film thickness is rigorously measured, and film opacity is determined instrumentally. Test Method D 344 is a practical test in which paint is applied with a brush, wet-film thickness is approximately controlled by spreading rate, and hiding power is evaluated visually by comparison with a standard paint, but results are affected by flow and levelling of the materials. Determine hiding power in accordance with Test Methods D 344 or D 2805.

9.6 Yellowness Index—The referenced method is used for white or near white specimens to determine color departure from white toward yellow when first applied. Determine the yellowness index in accordance with Method E 313. (See also 10.2.1.)

10. Properties of the Dry Film

10.1 Interior and Exterior Coatings:

10.1.1 Abrasion Resistance—Abrasion resistance is a measure of the ability of a dried film to withstand wear from foot traffic and marring from objects rolled or pulled across

the surface. In the referenced methods, dry abrasive is applied to a coated panel using the force of gravity or a jet blast for free-flowing abrasive or a weighted wheel for abrasive embedded in a resilient rubber matrix. Determine dry abrasion resistance in accordance with Test Methods D 658, D 968 or D 4060. (See 10.2.2.1 for wet abrasion resistance.)

NOTE 4—Because of the poor reproducibility of abrasion test methods, testing should be restricted to only one laboratory when numerical abrasion resistance values are to be used. Interlaboratory agreement is improved significantly when rankings are used in place of numerical values.

10.1.2 *Adhesion*—Adhesion is the property of a film that resists removal from the substrate. It is an important property in a paint. Determine adhesion in accordance with Test Method D 2197 or D 3359, or both.

10.1.3 *Flexibility*—Elongation is a measure of the flexibility of a coating film. Generally, gloss house paints and trim enamels have no problems in passing a mandrel bend test at $\frac{1}{8}$ in. (3.2 mm). However, interior flat and eggshell finishes may pass only a $\frac{1}{2}$ -in. (12.7-mm) bend. For exterior coatings Test Method D 2370 is a much more discriminating method.¹¹ Determine flexibility in accordance with Methods D 522 or elongation with D 2370.

10.2 Interior Finishes:

10.2.1 *Color Change of White Architectural Enamels*—Color permanence is an important characteristic for interior white enamels. Lack of permanence is usually caused by after-yellowing. The referenced method attempts to accelerate color change by exposing coatings to dry sulfur dioxide. Determine resistance to color change in accordance Test Method D 1543.

10.2.2 *Washability and Cleansability*—The capability of satisfactorily removing marks without damaging the film is essential for good performance of interior finishes. A coating may be washable, that is, unaffected by the detergent solution, but may not have good cleansability. Frequently the difference between the two terms "cleansability" and "washability", is not clearly understood so that there is confusion as to what is really being tested; for example, the title of Test Method D 3450. Cleansability is evaluated by applying one or more stains and soils and determining how readily they are removed. Washability is evaluated by determining the resistance of the film to wet erosion either by visual assessment or measured film loss. In general, the precision of both types of test is poor because several properties, such as hardness, water and detergent resistance, cohesion and adhesion, are involved and the end point, except for the wet abrasion method, is rather indefinite.

10.2.2.1 *Washability (Also referred to as Scrubbing or Wet Abrasion Resistance)*—The scrubbing method, Test Method D 2486, developed for interior latex flat wall paints can be applied to coatings of almost any type. In it the coating is applied to a black plastic panel that, during scrubbing with a nylon brush and abrasive cleaning agent, is raised by a narrow shim to concentrate the test area. The number of back-and-forth strokes (cycles) required to remove the film over the shim is determined. The wet-abrasion method, Test

Method D 4213, is similar except that a sponge is used in place of the bristle brush while the shim is not used. This method also provides for the use of a nonabrasive medium with paints having very low abrasion resistance. The weight or volume loss per 100 cycles to erode the film almost to exposure of the black substrate is the measure of scrub resistance. Evaluate washability, as described just, in accordance with Test Methods D 2486 or D 4213.

10.2.2.2 *Cleansability*—The older referenced method, Test Method D 3450, is similar to the wet-abrasion method, Test Method D 4213, except that the sponge is used with either the nonabrasive or abrasive cleaning agent to remove a carbon black-oil stain. The ability to remove the stain is expressed as the ratio (in percent relative) of the reflectance of the cleaned area to that of the area before application of the stain. In Test Method D 4828, referred to as a "practical" test, numerous staining and soiling agents found in service and commercial abrasive or nonabrasive cleaners as well as the standardized cleaning agents can be used. In the current edition the films are cleansed only manually with the result that the method is not suitable for interlaboratory testing. Evaluate ease of removability in accordance with Test Methods D 3450 or D 4828.

10.2.3 *Resistance to Household Chemicals*—An important property of interior coatings is the ability to resist spotting, softening or removal when subjected to household chemicals or strong cleaners. Determine resistance to these chemicals in accordance with Test Method D 1308.

10.3 Exterior Coatings:

10.3.1 *Blister Resistance*—Blister resistance is the ability of a dry film on wood to resist the formation of blisters caused by water from the wood substrate. In practice water can come from either the interior of a home or from structural defects that permit entry of exterior water behind the wood. Moisture blister resistance can be qualitatively evaluated in a laboratory test. Determine resistance to moisture blistering in accordance with Practice D 4585.

10.3.2 *Exposure Resistance*—If the coating is intended for exterior use, evaluation of the resistance to weathering may be required. In conducting exterior exposures follow Practice D 1006 for wood substrates or Test Method D 1014 for steel.

10.3.2.1 In establishing exterior performance on wood, use the panels described in Specification D 358.

10.3.2.2 *Degree of Chalking*—Determine the rating using Methods D 659 or D 4214.

10.3.2.3 *Degree of Checking*—Determine the rating using Test Method D 660.

10.3.2.4 *Degree of Cracking*—Determine the rating using Test Method D 661.

10.3.2.5 *Degree of Erosion*—Determine the rating using Test Method D 662.

10.3.2.6 *Degree of Flaking*—Determine the rating using Test Method D 772.

10.3.3 *Mildew Resistance*—Virtually all exterior paints are subject to microbiological discoloration on the surface with time. This is especially true in warm, moist climates. Determine mildew resistance in accordance with Practice D 3456.

10.3.4 *Fume Resistance*—Some paints exhibit a change in appearance (usually color) when exposed to air containing certain sulfur compounds, notably hydrogen sulfide and

¹¹ H. E. Ashton, *Journal of Coatings Technology*, Vol 51, June 1979, p. 41.

dioxide. This type of atmosphere may be present near material or other polluted areas and can cause paint to discolor or darken in as little time as overnight. There are no Federal test methods for evaluating this color change, but one procedure used by the industry is as follows:

11.4.1 Apply a sufficient number of coats of the paint to glass plates to hide the surface completely, allow to dry, and expose one in a moist atmosphere of hydrogen peroxide for 18 h. Compare the color with the unexposed plate. The exposed plate should be practically no darker than the unexposed one. The color difference should not exceed that of plates that have been coated with a paint made with titanium dioxide pigment, lead-free zinc oxide, raw or refined linseed oil, and sufficient cobalt added for drying, similarly treated.

Coating Analysis

11.1 *Coating Analysis*—If a specification requires certain materials or certain components in a given amount then analysis is needed to determine whether the specified components are present and in what amounts. Analysis is primarily a measure of uniformity and does not necessarily establish quality that can also be greatly affected by manufacturing techniques. No single schematic analysis is comprehensive enough to cover the wide variety of paint compositions. Select test procedures from Methods D 215 and other ASTM methods that are pertinent to the components of solvent-borne coatings.

11.2 *Volatile Content*—The percent of volatile matter is a measure of the amount of a film lost as it dries. This quantity is not necessarily indicative of the quality of the coating. It is useful, however, for determining the similarity of two coatings. The referenced method covers the determination of volatile content of solvent- and water-reducible coatings. The quantity determined subtracted from 100 % gives the volatile content of the coating. Determine the volatile content in accordance with Test Method D 2369.

11.3 *Nonvolatile Content (Volume Percent)*—The nonvolatile content by volume is a useful figure in calculating coverage or spreading capacity per gallon (or litre) at a specified dry-film thickness. Determine nonvolatile content by volume percent in accordance with Test Method D 2697.

11.4 *Water Content*—If too much water is incorporated in a solvent-reducible coating it may retard the drying at high relative humidities. The amount of water in a coating is required in the calculation of the volatile organic content (VOC) of coatings. One referenced method covers the determination of water in paint and related materials by distilling with a volatile solvent. The newer method utilizes the Karl Fischer reaction. Determine water in accordance with Test Methods D 1208 or D 4017.

11.5 *Pigment Content*—Pigment provides the hiding and color and influences many other properties of a coating. The referenced method describes the procedure for the quantitative separation of the vehicle from the pigment in solvent-reducible coatings. It is used to measure the weight percent pigment in the paint. Determine the percent pigment content in accordance with Test Method D 2371.

11.6 *Pigment Analysis*—The analysis of pigment may be required if the product is covered by a specification or upon agreement between the purchaser and seller. Analyze the pigment in accordance with selected test procedures from Methods D 215 and other appropriate ASTM methods.

11.7 *Nonvolatile Vehicle Content*—The nonvolatile vehicle is the film-forming portion of a coating excluding the pigment. Water, volatile thinner, and pigment are determined and their sum subtracted from 100 % to give the binder content in accordance with Methods D 215. The vehicle may be separated for further analysis.

11.8 *Separation of Vehicle*—The recommended procedure describes this separation for certain solvent-borne coatings. If desired or required, separate the vehicle in accordance with Method D 2372.

11.9 *Identification of Nonvolatile Vehicle*—The type of binder used in a coating has a great influence on its properties. The referenced method covers the qualitative characterization or identification by infra-red spectroscopy of separated nonvolatile vehicle. It is useful in detecting uniformity, batch to batch, and the presence of adulterants. Identify the nonvolatile vehicle in accordance with Method D 2621. The composition of this vehicle can be further broken down into the types of oils present. If desired determine the identity of oils in accordance with Method D 2245.

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 1916 Race St., Philadelphia, PA 19103.

tion was found to be 0.5 rating units with 36 df. Based on these values the following criterion should be used for judging the acceptability of results at the 95 % confidence level:

10.1.1 *Reproducibility*—Two single results obtained by operators in different laboratories should be considered

suspect if they differ by more than 1.5 rating units.

APPENDIX

Nonmandatory Information

X1. MANUFACTURER'S DESCRIPTION AND SPECIFICATIONS FOR THE PRACTICAL OPACITY CHARTS USED IN DEVELOPING THIS TEST METHOD⁵

X1.1 Description and Specifications are as follows:

X1.1.1 *Overall Size*—24 by 37½ in. (610 by 953 mm),

X1.1.2 *Test Area*—Size 24 by 36 in. (610 by 914 mm), 6 ft² (5575 cm²),

X1.1.3 *Design*—Alternate stripes of white and neutral grey,

X1.1.4 *Stripe Dimensions*—1½ by 36 in. (36 by 914 mm);

X1.1.5 *Stripe Numbers*—The stripes are numbered 1 through 6 in order of increasing contrast, the numbers being printed on the two 24-in. borders. These borders are ¾-in. (19-mm) wide and are not normally considered a part of the test area.

X1.1.6 *Unnumbered Stripes*—The unnumbered stripes shown in Figure 1 are an integral part of the test area. Their purpose is to favor application uniformity on the numbered stripes by preempting the boundary locations that tend to be less uniformly coated than more centrally located areas.

X1.1.7 *Grey Stripe Reflectances*⁵—The reflectance values of the numbered stripes are selected with the objective that their color differences with respect to the white surround will be in the geometric sequence: 2, 4, 8, 16, 32, and 64 CIELAB units. The defining variable for the grey stripes is not the

reflectance as such, but the ratio of the grey reflectance *G* to the white reflectance *W*. Table X1.1 shows the relevant relationships and production tolerances.

NOTE X1.1—The term "reflectance" as used here refers to the luminous reflectance factor as defined in 4.2 of Method E 97, which may be expressed as a decimal fraction or as a percentage. The latter is numerically the same as the CIE Y-tristimulus value and is the scale reading on most if not all commercial colorimeters.

TABLE X1.1 Relevant Relationships and Production Tolerances

Stripe Number	Color Difference, ^a %	Ratio <i>G/W</i> ^b	Reflectance <i>G</i> , ^c %
1	2 ± 12.5	0.945 ± 0.007	75.6 ± 0.6
2	4 ± 12.5	0.893 ± 0.013	71.4 ± 1.0
3	8 ± 12.5	0.793 ± 0.024	63.5 ± 1.9
4	16 ± 12.5	0.617 ± 0.042	49.4 ± 3.4
5	32 ± 12.5	0.347 ± 0.055	27.8 ± 4.4
6	64 ± 12.5	0.067 ± 0.037	5.3 ± 3.0

^a This is ΔE^*_{ab} , the color difference with respect to the white stripes, expressed in CIELAB units as defined in 6.2 of Method D 2244.

^b $G/W = (1 - \Delta E^*_{ab}/107.7)^2$. This equation is derived from 6.2.1 of Method D 2244 and assumes that for neutral grey versus white, the values ΔE^*_{ab} and ΔL^* are sufficiently close to be considered equal for the purpose of this test method.

^c Values shown here are with a white stripe reflectance *W* of 80 %. These values will vary somewhat with *W*, tolerances for the latter being ± 2 % inter-batch and ± 0.5 % intra-batch.

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 1916 Race St., Philadelphia, PA 19103.

Standard Guide for Specifying Inspection Requirements for Coating and Lining Work (Metal Substrates)¹

This standard is issued under the fixed designation D 5161; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

Scope

1.1 This guide is intended to aid the coating specification writer in selecting and specifying the appropriate inspection requirements. It indicates the inspection requirements that may be employed for each of four service environments including mild, moderate, severe, and immersion (see Table

1.2 In order to aid the user in determining when to specify inspection requirements, a relationship between the consequence of failure and the suggested level of inspection is demonstrated (see Fig. 1).

1.3 It is not the intent of this guide to address the selection of protective coating systems, to specify surface preparation and application requirements, or to be a referenced document in a specification.

3. Terminology

3.1 *Service Environments Terms are as follows:*

- 3.1.1 *mild service*—indoor or protected outdoor areas not subject to rain, dew or corrosive elements, or both.
- 3.1.2 *moderate service*—areas subject to weather away from coastal or corrosive industrial environments, or both.
- 3.1.3 *severe service*—corrosive/erosive environments including coastal salt laden atmosphere, industrial atmosphere, and high intensity sunlight.
- 3.1.4 *immersion service*—wetted surfaces of tanks, containers, pits, etc and surfaces that are normally wet with condensation or exposed to other corrosive environments.

4. Significance and Use

- 4.1 The requirements for inspection should be addressed in all protective coating and lining work specifications.
- 4.2 This guide may be used by specification writers when selecting and establishing the inspection requirements for coating and lining specifications.
- 4.3 The instructions for using this guide are as follows:
 - 4.3.1 Identify the service environment for the coating or lining system being specified. Read down the column under the appropriate service environment in Table I. Suggested levels of inspection listed on the left are identified with x's.

5. Inspection Requirements

5.1 *Pre-Surface Preparation:*

- 5.1.1 *Contaminants*—Visually verify that oil and grease are removed from the surface prior to surface preparation operations (see Guide D 3276).
- 5.1.2 *Surface Anomalies*—Visually verify that welds and sharp or jagged edges have been suitably prepared for the coating system being used (see Guide D 3276).
- 5.2 *Surface Preparation:*
 - 5.2.1 *Air Supply*—Verify that air supply is clean and dry (see Test Method D 4285).
 - 5.2.2 *Abrasives*—Verify cleanliness and proper size and type to achieve specified profile.
 - 5.2.3 *Ambient Conditions*—Verify that air temperature, humidity, surface temperature, and dew point spread are appropriate (see Test Method E 337).
 - 5.2.4 *Surface Anomalies*—Identify any burrs, slivers, scabs, and weld spatter visible after blasting.

Final cure			X	X

5.2.5 *Surface Cleanliness*—Verify degree of surface cleanliness (see SSPC-Visl-89).

5.2.6 *Profile*—Verify profile is within specified tolerance using appropriate instruments (see Test Method D 4417).

5.2.7 *Surface Contamination*—Verify that all visible surface contaminants including oil, grease, dust, etc have been removed.

5.3 Coating Application:

5.3.1 *Materials*—Verify that the coating materials and thinners are as specified, properly labeled and stored, and are within their shelf life.

5.3.2 *Mixing*—Verify that the coating materials are mixed in accordance with the manufacturer's instructions.

5.3.3 *Equipment*—Verify that proper application equipment is being utilized.

5.3.4 *Air Supply*—Verify that air supply is clean and dry (see Test Method D 4285).

5.3.5 *Ambient Conditions*—Verify that air temperature, humidity, surface temperature, and dew point spread are appropriate (see Test Method E 337).

5.3.6 *Wet Film Thickness*—Verify that the applicator is checking wet film thickness during the application process when required (see Practice D 4414).

5.3.7 *Intercoat Parameters*—Verify that parameters during recoat are observed and that no surface contaminants are present.

SERVICE ENVIRONMENT

NOTE—This figure is provided as a visual aid to represent graphically the general relationship between the consequence of failure and the suggested level of inspection. The slope and configuration of the curve will vary due to the many factors affecting the consequence of failure, however, the suggested level of inspection should increase when the service environment is more severe.

FIG. 1 Relationship Between the Consequence of Failure and the Suggested Level of Inspection

5.3.8 *Appearance*—Visually inspect each coat for defects and uniform appearance (see Guide D 3276).

5.3.9 *Dry Film Thickness*—Verify that the dry film thickness is within the specified range after each coat (see Test Methods D 1186 and D 1400).

5.4 Final Acceptance:

5.4.1 *Appearance*—Visually inspect the surface for defects and uniform appearance (see Guide D 3276).

5.4.2 *Dry Film Thickness*—Verify that the total coating system's dry film thickness is within the specified range (see Test Methods D 1186 and D 1400).

5.4.3 *Holiday Test*—Verify that the surface meets the specified holiday/pinhole criteria (see NACE T6A-37).

5.4.4 *Repairs*—Verify that all identified repairs have been properly made. Repeat inspection requirements and testing as appropriate.

5.4.5 *Final Cure*—Verify that the coating is cured in accordance with the specified requirements of Guide D 3276.

6. Precautions and Limits

6.1 Specialty lining systems such as reinforced laminates may have additional inspection requirements to address hardness, strength, etc that are not addressed by this guide.

6.2 The quality of a project cannot be guaranteed by merely specifying inspection requirements, however, when the recommended inspections are properly implemented and documented, failures are minimized or eliminated.

7. Keywords

7.1 coating, inspection, specifications; consequence of failure; level of inspection; linings

Standard Practice for Discontinuity (Holiday) Testing of Nonconductive Protective Coating on Metallic Substrates¹

This standard is issued under the fixed designation D 5162; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This practice covers procedures for determining discontinuities using two types of test equipment:

- 1.1.1 *Test Method A—Low Voltage Wet Sponge, and*
- 1.1.2 *Test Method B—High Voltage Spark Testers.*

1.2 This practice addresses metallic substrates. For concrete surfaces, refer to Practice D 4787.²

1.3 *This standard does not purport to address all of the safety problems, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

2. Referenced Documents

2.1 *ASTM Standards:*

D 4787 Practice for Continuity Verification of Liquid or Sheet Linings Applied to Concrete Substrates²

3. Terminology

3.1 *Description of Terms Specific to This Standard:*

3.1.1 *discontinuity, as used in this standard*—a void, crack, thin spot, foreign inclusion, or contamination in the coating film that significantly lowers the dielectric strength of the coating film. May also be identified as a holiday or pinhole.

3.1.2 *holiday, as used in this standard*—a term that identifies a discontinuity.

3.1.3 *holiday detector, as used in this standard*—a device that locates discontinuities in a nonconductive coating film applied to a conductive surface.

3.1.4 *pinhole, as used in this standard*—a film defect characterized by small porelike flaws in the coating which, when extended entirely through the film, will appear as a discontinuity. A pinhole in the finish coat may not appear as a discontinuity.

4. Significance and Use

4.1 A coating is applied to a metallic substrate to prevent corrosion, reduce abrasion or reduce product contamination, or both. The degree of coating continuity required is dictated by service conditions. Discontinuities in a coating are frequently very minute and not readily visible. This practice provides a procedure for electrical detection of minute

discontinuities in nonconductive coating systems.

4.2 Electrical testing to determine the presence and number of discontinuities in a coating film is performed on a nonconductive coating applied to a conductive surface. The allowable number of discontinuities should be determined prior to conducting this test since the acceptable quantity of discontinuities will vary depending on coating film thickness, design, and service conditions.

4.3 The low voltage wet sponge test equipment is generally used for determining the existence of discontinuities in coating films having a total thickness of 20 mils (0.5 mm) or less. High voltage spark test equipment is generally used for determining the existences of discontinuities in coating films having a total thickness of greater than 20 mils (0.5 mm).

4.4 Coatings that are applied at a thickness of less than 20 mils (0.5 mm) may be susceptible to damage if tested with high voltage spark testing equipment. Consult the coating manufacturer for proper test equipment and inspection voltages.

4.5 To prevent damage to a coating film when using high voltage test instrumentation, total film thickness and dielectric strength in a coating system shall be considered in selecting the appropriate voltage for detection of discontinuities. Atmospheric conditions shall also be considered since the voltage required for the spark to gap a given distance in air varies with the conductivity of the air at the time the test is conducted. Suggested starting voltages are provided in Table 1.

4.6 The coating manufacturer shall be consulted to obtain the following information, which would affect the accuracy of this test to determine discontinuities:

4.6.1 Establish the length of time required to adequately dry or cure the applied coating film prior to testing. Solvents retained in an uncured coating film may form an electrically conductive path through the film to the substrate.

4.6.2 Determine whether the coating contains electrically

TABLE 1 Suggested Voltages for High Voltage Spark Testing

Total Dry Film Thickness		Suggested Inspection, V
mils	mm	
8-12	0.20-0.31	1 500
13-18	0.32-0.46	2 000
19-30	0.47-0.77	2 500
31-40	0.78-1.03	4 000
41-60	1.04-1.54	5 000
61-80	1.55-2.04	7 500
81-100	2.05-2.55	10 000
101-125	2.56-3.19	12 000
126-160	3.20-4.07	15 000
161-200	4.08-5.09	20 000
201-250	5.10-6.35	25 000

¹ This practice is under the jurisdiction of ASTM Committee D-33 on Protective Coating and Lining Work for Power Generation Facilities and is the direct responsibility of Subcommittee D33.04 on Inspection.

² *Annual Book of ASTM Standards*, Vol 06.01.

ductive fillers or pigments that may affect the normal electric properties.

5.1.7 This practice is intended for use with new coatings. It may also be applicable for coatings previously placed in service. However, considerations must be given to potential changes in the electrical properties of the coating due to service exposure.

Test Methods

TEST METHOD A—LOW VOLTAGE WET SPONGE TESTING

1 Apparatus

5.1.1 *Low Voltage Holiday Detector*—an electronic device powered by a self-contained battery with voltages ranging from 5 to 90 V dc, depending on the equipment manufacturer's circuit design. It is used to locate discontinuities in a nonconductive coating applied to a conductive substrate. Operation includes the use of an open-cell sponge electrode wetted with a solution for exploring the coating surface, a ground connection, and an audible or visual indicator, or both, for signaling a point of coating discontinuity.

5.1.2 *Low Voltage Wet Sponge Tester*—a sensitivity device with the operating voltage being of little importance other than being part of the particular electronic circuit design.

5.1.3 *Wet Sponge Type Instrument*—a number of commercially available, industry-accepted, instruments are available. The following electronic principle describes two types of devices generally used; others may be available but are not described in this practice.

5.1.3.1 *Lightweight, Self-Contained, Portable Devices*—based on the electrical principle of an electromagnetic sensitive relay or a solid-state electronic relay circuit that energizes an audible or visual indicator when a coating discontinuity is detected. Generally this equipment is capable of being recalibrated in the field by the user.

5.1.3.2 *Lightweight, Self-Contained, Portable Devices*—also based on the principle of an electronic relaxation oscillator circuit that reacts significantly to the abrupt drop in electrical resistance between the high dielectric value of the coating film and the conductive substrate at the point of coating film discontinuity. This results in a rise in oscillator frequency as well as in the audible signal from the device. Generally, this equipment is incapable of being recalibrated in the field by the user.

2 Procedure

5.2.1 Sufficient drying or curing of the coating shall be allowed prior to conducting a test. The length of time required shall be obtained from the coating manufacturer. Solvents retained in the coating film could produce erroneous indicators.

5.2.2 The surface shall be clean, dry, and free of oil, dirt and other contaminants. Measure the film thickness of the coating with a nondestructive dry film thickness gage. If the coating film exceeds 20 mils (0.5 mm), use the procedures for high voltage spark testing described in Test Method B, High Voltage Spark Testing.

5.2.3 Test the instrument for sensitivity in accordance with 5.3.

5.2.4 Attach the ground wire from the instrument ground output terminal to the metallic substrate and ensure positive electrical contact.

5.2.5 Attach the exploring sponge lead to the other output terminal.

5.2.6 Wet the sponge with a solution consisting of tap water and a low sudsing wetting agent, combined at a ratio of not more than 1/2 fluid oz of wetting agent to 1 gal water. An example of a low sudsing wetting agent is one used in photographic development. The sponge shall be wetted sufficiently to barely avoid dripping of the solution while the sponge is moved over the coating. The wetting agent residue must be removed prior to executing repairs.

5.2.7 Sodium chloride (salt) shall not be added to the wetting solution because of the potential erroneous indications of discontinuities. The salt, after drying on the coated surface, may form a continuous path of conductivity. It will also interfere with intercoat adhesion of additional coats.

5.2.8 Contact a bare spot on the conductive substrate with the wetted sponge to verify that the instrument is properly grounded. This procedure shall be repeated periodically during the test.

5.2.9 Move the sponge over the surface of the coating at a moderate rate approximately 1 ft/s (0.3 m/s), using a double pass over each area. Apply sufficient pressure to maintain a wet surface. If a discontinuity is detected, turn the sponge on end to determine the exact location of the discontinuity.

5.2.10 Discontinuities that require repair shall be identified with a marker that is compatible with the repair coating or one that is easily removed.

5.2.11 To prevent telegraphing (current traveling through a moisture path to a discontinuity, giving an erroneous indication), take care to ensure that the solution is wiped dry from a previously detected discontinuity before continuing the test.

5.2.12 The wetting agent must be completely removed by rinsing the holiday area prior to repair.

5.2.13 Wet sponge holiday detection is not recommended between coats of a multicoat system. However, when a test is conducted between coats of a multicoat system, a wetting agent shall not be used and all residue left by the test water must be completely removed prior to applying additional coats.

5.3. Verifying Operation of Equipment

5.3.1 The instrument shall be tested for sensitivity prior to initial use and periodically thereafter, in accordance with the equipment manufacturer's instructions.

5.3.2 Test the battery for proper voltage output. Refer to the manufacturer's instructions.

5.3.3 Switch the instrument to the "on position," if applicable.

5.3.4 Wet the sponge with a wetting solution consisting of tap water and a wetting agent (see 5.2.6).

5.3.5 Connect the ground cable to the instrument ground output terminal.

5.3.6 Touch the ground cable alligator clip to the wetted sponge. The instrument signal should actuate in accordance with the instrument manufacturer's instructions.

5.3.7 If the instrument should fail to signal, it shall be considered defective.

5.4 Verifying Instrument Calibration

5.4.1 Verify instrument calibration in accordance with the manufacturer's latest published instructions. If out of calibration, the instrument shall be calibrated in accordance with the instrument manufacturer's latest published instructions, or returned for calibration.

TEST METHOD B—HIGH VOLTAGE SPARK TESTING

5.5 Apparatus

5.5.1 *High Voltage Detector (in excess of 800 V)*—An electronic device used to locate discontinuities in a nonconductive protective coating applied to a conductive substrate. It consists of an electrical energy source, an exploring electrode, and a ground wire connection from the indicator signaling current flow through a coating film discontinuity to the substrate. The detector shall be equipped with a visual or audible indicator, or both.

5.5.2 *Exploring Electrode*, shall be of the type capable of maintaining continuous contact with the surface being inspected, such as bolts, raised areas, etc. It shall be kept clean and free of coating material.

5.5.3 *High Voltage Electrical Detector*, can be identified as either a pulse or direct current type. A pulse type detector discharges a cycling, high voltage pulse, while a direct current type discharges continuous voltage.

5.6 Procedure

5.6.1 Sufficient drying or curing of the coating shall be allowed prior to conducting a holiday test. The length of time required shall be obtained from the coating manufacturer. Solvents retained in the coating film could produce erroneous results, as well as a fire hazard.

5.6.2 The surface shall be clean, dry, and free of oil, dirt and other contaminants. Measure thickness of the coating with a nondestructive dry film thickness gage. If the coating film is less than 20 mils (0.5 mm), consider using procedures for low voltage testing (see Test Method A, Low Voltage Wet Sponge Testing). Although the high voltage spark tester is suitable for determining discontinuities in coating films of less than 20 mils (0.5 mm), it is recommended that the coating manufacturer be consulted before using this test. Certain coatings may be damaged if tested with this equipment.

5.6.3 Verify test instrument operation in accordance with 5.7.

5.6.4 Adjust the test instrument to the proper voltage for the coating thickness being tested. In selecting the inspection voltage, it is important to provide sufficient voltage to break the air gap that exists at the holiday. The air gap will vary depending on the total applied film thickness. The voltage required to break a given air gap may also vary due to atmospheric conditions such as relative humidity. Ensure that the voltage is high enough to break the air gap equivalent to the highest coating film thickness by separating the exploring electrode from the bare metal substrate using a nonconductive spacer equal to the maximum coating thickness. The voltage is set high enough to conduct the holiday test only if the spark will jump the gap formed by the spacer. Excessive voltage may produce a holiday in the coating film. The maximum voltage for the applied coating shall be

obtained from the coating manufacturer. Table 1 contains suggested voltages that can be used as guides.

5.6.5 Attach ground wire from the instrument ground output terminal to the metal substrate and ensure positive electrical contact.

5.6.6 Make contact with the exploring electrode on the conductive substrate to verify that the instrument is properly grounded. This test shall be conducted periodically during the test. The spacer test described in 5.6.4 shall also be repeated if significant atmospheric changes take place during testing.

5.6.7 Move the exploring electrode over the surface of the dry coating at a rate of approximately 1 ft/s (0.3 m/s) using a single pass. Moisture on the coating surface may cause erroneous indications. If moisture exists, remove or allow to dry before conducting test.

5.6.8 Discontinuities that require repair shall be identified with a marker that is compatible with the repair coating or one that is easily removed.

5.7 Verifying Operation of Equipment

5.7.1 Test the energy source (battery) for proper voltage output. Refer to the manufacturer's instructions.

5.7.2 Connect the exploring electrode and grounding cable to the terminals of the detectors.

5.7.3 Switch the instrument to the "on" position.

5.7.4 Touch the exploring electrode to the ground cable alligator clip. The instrument signal should actuate in accordance with the instrument manufacturer's operating instructions.

5.7.5 If the instrument fails to signal, it shall be considered defective.

5.8 Verifying Instrument Calibration

5.8.1 Verify instrument calibration in accordance with the manufacturer's latest published instructions. If out of calibration, the instrument shall be calibrated in accordance with the instrument manufacturer's latest published instructions, or returned for calibration.

5.8.2 Perform field checking of the test voltage with the electrode placed against the surface of the lining since the exploring electrode voltage may be reduced by the slight current flow of the lining.

5.8.3 If required, compare measured voltage with the selected test voltage. Depending on the type of tester, adjust the selected voltage $\pm 5\%$.

6. Testing of Repaired Area

6.1 Sufficient drying or curing of the repair coating shall be allowed prior to retesting. The length of time required shall be obtained from the coating manufacturer.

6.2 Conduct the test following the procedures as previously outlined in this practice for the test instrument selected.

6.3 Retest only those areas that have been repaired, unless otherwise specified.

7. Keywords

7.1 discontinuity; holiday; holiday detectors; spark testers

Standard Guide for Establishing Procedures to Monitor the Performance of Safety Related Coatings in an Operating Nuclear Power Plant¹

This standard is issued under the fixed designation D 5163; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This guide covers procedures for establishing a program to monitor Service Level I coating systems in operating nuclear power plants. Monitoring is an on going process of evaluating the condition of the in-service coating systems.

1.2 It is the intent of this guide to provide a recommended basis for establishing a coatings monitoring program, not to mandate a singular basis for all programs. Variations or simplifications of the program described in this guide may be appropriate for each operating nuclear power plant depending on their licensing commitments. Similar guidelines may be applicable for Service Level II and other areas outside containment.

1.3 *This standard does not purport to address all of the safety problems, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

2.3 SSPC Standard:

SSPC-PA2—Measurement of Dry Paint Thickness With Magnetic Gages⁵

2.4 NACE Standard:

RP0188-88—Standard Practice Discontinuity (Holiday) Testing of Protective Coatings⁶

3. Significance and Use

3.1 Establishment of an in-service coatings monitoring program permits planning and prioritization of coatings maintenance work as needed to maintain coat integrity and performance in nuclear Service Level I coating systems. For additional information on nuclear maintenance coating work, refer to ASTM Manual on Maintenance Coatings for Nuclear Power Plants.⁷

3.2 A coatings monitoring program enables early identification and detection of potential problems in coating systems. Some Service Level I coating systems may be known in advance to be suspect, deficient, or unqualified. Monitoring coating performance will assist in developing follow-up procedures to resolve any significant deficiency relative to coating work.

3.3 Degraded coatings may generate debris under design basis accident conditions that could adversely affect the performance of the post-accident safety systems. A coatings monitoring program may be required to fulfill safety analysis report commitments for Service Level I coating work in a nuclear power plant facility.

4. Responsibility

4.1 The owner/operator shall identify the department or group within the organization to be responsible for establishing the applicable requirements for activities or procedures covered by this guide and shall document the scope of their responsibility. Owner/operator delegation of this responsibility to other outside qualified organizations is per-

⁴ Available from American National Standards Institute, 11 W. 42nd Street, 13th Floor, New York, NY 10036.

⁵ Available from Steel Structures Painting Council, 4400 Fifth Ave., Pittsburgh, PA 15213.

⁶ Available from National Association of Corrosion Engineers, P. O. Box 218340, Houston, TX 77218.

⁷ Available from ASTM Headquarters, 1916 Race St., Philadelphia, PA 19103.

mitted and shall be documented.

4.2 It is the responsibility of the owner/operator or his designee performing these activities to specify the detailed methods and procedures for meeting the applicable requirements of this guide.

4.3 The owner/operator or his designee shall assign a coordinator to be responsible for supervising coating inspection activities, data collection and documentation, and for ensuring that inspection personnel are adequately trained and qualified.

4.4 The owner/operator shall assign responsibility for evaluating the results of inspection activities carried out under the coatings performance monitoring program.

Frequency

5.1 Frequency of in-service coating inspection monitoring shall be determined by the owner/operator. In operating nuclear power plants certain monitoring activities may be restricted to major maintenance outages or refueling outages. It is a good practice to perform inspections during each refueling outage or during other major maintenance outages as needed.

Records and Past History

6.1 Coating performance will depend on the operating conditions experienced by the coating systems. Records of these conditions shall be obtained for each operating unit. These may include, but not be limited to, ambient conditions, temperatures, humidity, immersion, splash and spillage, chemical exposures, radiation exposures, previous decontamination procedures, abrasion and physical abuse, and start-up/shutdown frequency. Any change in service criteria or modifications of the physical design must be identified and dated.

6.2 The last two performance monitoring reports pertaining to the coating systems shall be reviewed prior to the monitoring process. Other past coatings history data to be reviewed may include:

6.2.1 Copies of coating specifications, manufacturer's product data sheets, and application procedures for in-place coatings.

6.2.2 Quality control documentation for the existing in-place coating systems and their application.

6.2.3 Copies of previous inspection or monitoring reports.

6.2.4 Documentation pertaining to any maintenance work performed on existing coating systems.

Premonitoring Procedure

7.1 Prior to conducting an inspection of the coating systems, the responsible organization shall ensure that the necessary services and equipment required for inspection are provided. Factors that must be considered while planning the inspection activities include, but are not limited to, lighting, access to coated surfaces, cleaning surfaces of any deposit or build up, ventilation and, where necessary, special underwater inspection requirements.

7.2 Station access procedures for Service Level I coating systems monitoring shall be followed. While access procedures may vary from plant to plant, specific station access procedures may include:

7.2.1 Security clearance for protected, radiation con-

trolled, and vital areas, and escorted or unescorted clearance as required.

7.2.2 Radiological history including prior radiation exposure for all personnel involved.

7.2.3 Health physics classroom training in the use of radiation detection and monitoring devices and procedures for wearing anticontamination clothing.

7.2.4 A radiation work permit based on health physics radiological survey of the work location.

7.2.5 Compliance with radiation work permit requirements and other special radiation controls unique to each work location, and

7.2.6 Issuance of dosimetry.

7.3 The safety requirements of the facility owner/operator must be met when performing all inspection operations.

8. Personnel Requirements, Qualifications, and Training

8.1 The facility owner/operator shall specify the requirements and guidelines for qualification and training of inspection personnel involved in the program. However, inspectors and the coordinator shall be knowledgeable coatings personnel meeting the requirements of ASTM Guide D 4537 or ANSI N45.2.6. The coordinator shall, as a minimum, be a Level II Coatings Inspector.

8.2 The evaluator shall be a person knowledgeable and experienced in nuclear coatings work.

9. Inspection Plan

9.1 The owner/operator shall develop a plant specific inspection plan to accomplish the objectives of the monitoring program. A general visual inspection shall be conducted on all readily accessible coated surfaces during a walk-through. After the walk-through, thorough visual inspections shall be carried out on previously designated areas and on areas noted as deficient during the walk-through. A thorough visual inspection shall also be carried out on all coatings near sumps or screens associated with the Emergency Core Cooling System (ECCS). The inspection plan shall address the following based on specific owner/operator requirements:

9.1.1 A pre-inspection briefing to familiarize all inspection personnel with objectives of the inspections, procedures to be followed, and precautions to be taken.

9.1.2 Monitoring team(s) assignments to specific areas for inspection(s), and

9.1.3 Location maps dividing the plant into identifiable areas for inspection activities to be issued to inspection teams. The maps shall also identify items/areas requiring special testing, if any. The locations of all defects and of all tests performed shall be recorded on the maps so that additional testing, recoating, and further monitoring may be performed.

9.2 During walk-through, visually examine coated surfaces for any visible defects, such as blistering, cracking, flaking/peeling, rusting, and physical damage.

9.2.1 *Blistering*—Compare any blistering found to the blistering pictorial standards of coatings defects (refer to Test Method D 714) and record size and frequency. If the blisters are larger than those on the comparison photographs, measure, record size and extent, and photograph. Report if blistered portions are intact.

9.2.2 *Cracking*—Cracking can be limited to the one layer of coating or extend through to the substrate. Measure the length of the crack or if extensive cracking has occurred, measure the size of the area affected. Determine if the cracking is isolated or is part of a pattern. Record measurements and describe crack depth and pattern on the inspection report. Photograph the area affected.

9.2.3 *Flaking/Peeling/Delamination*—Measure the approximate size of the peels and note the pattern formed. Carefully test to see if lifting can be easily achieved beyond the obvious peeled area. Note all observations on the inspection report and photograph the area affected.

9.2.4 Rusting—Compare with the pictorial standards of Test Method D 610 to determine the degree of rusting. Try to determine the source of rusting (that is, is it surface stain caused by rusting elsewhere, or is it a failure of the coating allowing the substrate to rust). Photograph the affected area and record observations on the inspection report.

9.2.5 If no defects are found, mark "Coating Intact, No Defects" on the inspection report.

9.2.6 If portions of the coating cannot be inspected, note the specific areas on the location map-inspection report, along with the reason why the inspection cannot be conducted.

9.3 Written or photographic documentation, or both of coating inspection areas, failures, and defects shall be made and the process of documentation standardized by the facility owner/operator. Written documentation practice for inspection of coating system as given in Practices F 1130, F 1131, F 1132, and F 1133 may be adopted as a guideline. Practice D 4121 provides one method to obtain consistent, comparable close-up photographs.

9.4 For coating surfaces determined to be suspect, defective or deficient, one or more physical tests, such as dry film thickness (Test Methods D 1186 and SSPC-PA-2), adhesion (Test Methods D 3359 and D 4541), and continuity (NACE-RP0188-88), may be performed when directed by the evaluator. Samples may be gathered, and the size and extent of defective patterns may be described.

9.5 Instruments and equipment needed for inspection may include, but not be limited to, flashlights, spotlights, marker pen, mirror, measuring tape, magnifier, binoculars, 35-mm camera with or without wide angle lens, and polyethylene zip lock sample bags.

10. Reporting and Documentation

10.1 Inspection reports for submittal to responsible evaluation personnel based on specific owner/operator requirements should be prepared by a qualified Level II or Level III Coatings Inspector and should include at least the following information:

10.1.1 A list and location of all areas evidencing deterioration.

10.1.2 Prioritize the repair areas into areas that must be repaired during the same outage and areas where repair can be postponed to future outages, keeping the coating under surveillance in the interim period.

10.1.3 *Inspection Data Sheets*—A typical data sheet is given in Fig. 1, and

10.1.4 *Photographic Documentation*—A typical location map for photographic identification is given in Fig. 2. The

[illegible]

FIG. 1 Inspection Data Sheet

FIG. 2 Photographic Documentation Location Map

tion and direction of all photographs shall be recorded on the maps for comparison with past and future photographs and to record existing conditions. Numbers 3-1 through 3-13 in Fig. 2 depict the location of the photographs and the directions of the view.

Evaluation

11 The inspection report shall be evaluated by the responsible evaluation personnel. The evaluator shall prepare a report that includes a summary of findings and recommendations for future surveillance or repair; this

would include an analysis of the reasons or suspected reasons for failure. The repair work should be prioritized into major and minor defective areas. A recommended corrective plan of action must be provided for the major defective areas so that the plant can repair these areas, if appropriate, during the same outage.

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 1916 Race St., Philadelphia, PA 19103.

Standard Test Method for Mar Resistance of Organic Coatings¹

This standard is issued under the fixed designation D 5178; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This test method covers the determination of the mar resistance on smooth, flat surfaces. Results are expressed in terms of force-to-mar films of organic coatings such as paint, varnish, and lacquer when applied to smooth, flat planar panel surfaces.

1.2 *This standard does not purport to address all of the safety problems, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

2. Referenced Documents

2.1 ASTM Standards:

- D 609 Methods for Preparation of Steel Panels for Testing Paint, Varnish, Lacquer, and Related Products²
- D 823 Test Methods for Producing Films of Uniform Thickness of Paint, Varnish, and Related Products on Test Panels²
- D 1005 Test Method for Measuring of Dry-Film Thickness of Organic Coatings Using Micrometers²

- D 1400 Test Methods for Nondestructive Measurement of Dry Film Thickness of Nonconductive Coatings Applied to a Nonferrous Metal Base²
- D 2691 Test Methods for Microscopical Measurement of Dry Film Thickness of Coatings on Wood Products²

3. Terminology

3.1 *mar resistance*—the ability of a coating to resist damage caused by light abrasion. As just defined, it is a resistance of the surface of the coating to permanent deformation, resulting from the application of a dynamic mechanical force.

4. Summary of Test Method

4.1 The materials under test are applied at uniform thickness to flat panels of uniform surface texture. After drying/curing, the mar resistance is determined by pushing the panels beneath a rounded stylus or loop that is loaded in increasing amounts until the coating is marred.

5. Significance and Use

5.1 In some situations, marring of coatings applied to substrates under typical use conditions is unacceptable. This test method has been found useful in differentiating the degree of marring of coatings on substrates. It is most useful in providing relative ratings for a series of coated panels exhibiting significant differences in marring.

6. Apparatus

6.1 *Application Equipment*, as described in Test Methods D 823.

6.2 *Film-Thickness Measuring Apparatus*, as described in Test Methods D 1005, D 1186, D 1400, or D 2691.

6.3 *Balanced Beam Scrape Adhesion and Mar Tester* (Figs. 1 and 2),³ consisting of a balanced beam to which is secured a platform for supporting weights, and a rod at an angle of 45° that holds the scraping loop, a polished, chromium plated steel rod hardened to Rockwell 56 to 58. The loop shall be a $\frac{1}{16}$ -in. (1.6-mm) diameter rod bent into a "U" shape with an outside radius of 0.128 ± 0.002 in. (3.25 ± 0.05 mm). These testers are adjustable to accommodate flat, metallic, and nonmetallic specimens to 0.5 in. (12 mm) thick and 4 to 16 in. (100 to 400 mm) wide and long; the specimen should be at least $\frac{1}{2}$ in. (12 mm) wide.

7. Preparation of Specimens

7.1 Apply the materials under test to panels of the composition and surface condition on which it is desired to determine mar resistance of the coating. The panel material (7.1.1), surface preparation, thickness, and number of coats shall be specified or agreed upon between the seller and the purchaser. Apply coatings and air dry or bake under conditions of humidity and temperature mutually agreeable to the seller and the purchaser.

7.1.1 The surface of the coating must be hard enough to resist damage by the scraping loop at a load agreed upon between the producer and the user. If no panel material is specified, use 0.032-in. (0.8-mm) cold-rolled carbon steel prepared in accordance with Methods B or C of Methods D 609.

8. Conditioning and Number of Tests

8.1 Condition the test panels for at least 48 h at $23 \pm 2^\circ\text{C}$ ($73.5 \pm 3.5^\circ\text{F}$) and $50 \pm 5\%$ relative humidity, and test in the same environment, or immediately on removal therefrom, unless otherwise specified or agreed upon by the seller

¹ This test method is under the jurisdiction of ASTM Committee D-1 on Paints and Related Coatings and Materials and is the direct responsibility of Subcommittee D01.23 on Physical Properties of Applied Paint Films. Current edition approved Oct. 15, 1991. Published December 1991.

² Annual Book of ASTM Standards, Vol 06.01.

³ The tester is available from BYK-Gardner, Inc., 2435 Linden Lane, Silver Spring, MD 20910 or the Paul N. Gardner Company, Inc., 316 N.E. First St., Pompano Beach, FL 33060.

and the purchaser. Test at least two replicate specimens of each material.

Procedure

9.1 In preparation for using the apparatus, ensure that it is reasonably level and place it so that the weight holder is toward the operator. This places the beam release on the operator's right and allows freedom to move the test specimen manually under the weighted scraping element (loop). Insert the loop into the holder as far as it will go and tighten the clamping screw. Adjust the main bearing support so that the beam is balanced in the horizontal plane when the loop is just touching the specimen surface. The alignment of the beam should be such that the end of the loop is over the midline of the movable table.

9.2 Raise the beam and lock it in the raised position. Wipe the loop with a clean cloth or chamois. Locate the specimen on the sliding platform against the stop so that the specimen can be moved away from the operator and there is an area at least 3 in. (75 mm) long by 1/2 in. (12 mm) wide on the sample parallel to the horizontal plane through the beam. Place weights on the weight support using an initial amount that is estimated to be appropriate for the particular coating. Release the beam and carefully lower it until the loop rests on the coated test specimen and the full load is applied, then slowly push the sliding platform away from the operator at a rate of 1/4 in. (6 mm)/s for a distance of at least 3 in. (75 mm). If the coating is marred, continue the testing using successively smaller loads (0.5-kg increments) until the coating is not marred. If the coating is not marred by the initial scrape, continue the test using successively larger loads

FIG. 2 Balanced Beam Scrape Adhesion and Mar Tester

(0.5-kg increments) until the coating is marred or until the maximum load of 10 kg has been applied. Use a new area of the test surface each time a scrape is made.

9.3 When the critical load has been approximately located, repeat the test five times at each of three loadings: above, below and at the load determined in the first trial. Apply different loads in random fashion so that all scrapes at one load are not made in succession or on one panel.

9.3.1 Periodically examine the loop to ensure that the original smooth surface is intact. If the contacting surface is worn, reverse the loop. When both sides are worn, replace with a new loop.

9.4 For each applied load, tabulate the number of times the coating was marred.

10. Report

10.1 Report the following information:

- 10.1.1 Load at the marring failure point, kg,
- 10.1.2 Panel material and surface preparation,
- 10.1.3 Dry-film thickness, and
- 10.1.4 Any deviation from the specified procedure.

11. Precision

11.1 *Precision*—If sufficient cooperators can be obtained, an interlaboratory study will be conducted to establish precision.

12. Keywords

12.1 balanced beam scrape adhesion and mar tester; balanced beam tester; coatings, mar or organic mar resistance

FIG. 1 Balanced Beam Scrape Adhesion and Mar Tester

Standard Test Method for Measuring Adhesion of Organic Coatings to Plastic Substrates by Direct Tensile Testing¹

This standard is issued under the fixed designation D 5179; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This test method covers the laboratory determination of organic coating adhesion to plastic substrates by mounting and removing an aluminum stud from the surface of the coating and measuring the force required to break the coating/substrate bond with a tensile tester.

1.2 This test method requires that the aluminum stud be glued directly to the surface of a coated, cured panel (Fig. 1).

1.3 This test method is used to compare the adhesion of coatings to various plastic substrates, thus allowing for a quantitative comparison of various coating/substrate combinations.

1.4 This standard does not purport to address all of the safety problems, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Summary of Test Method

2.1 An aluminum stud is bonded directly to a coated cured panel. The adhesive is allowed to cure for 2 h at room temperature. The specimen is then subjected to test on a tensile tester equipped with an upper coupling adaptor (Fig. 2), and a restraining device (Fig. 3).

3. Significance and Use

3.1 The pull-off strength (commonly referred to as adhesion) of a coating is an important performance property that has been used in specifications. This test method serves as a means for uniformly preparing and testing organic coatings on plastic substrates.²

4. Apparatus and Materials

4.1 *Tensile Tester*, commercially available.³

4.2 *Aluminum Stud*—The shape and dimensions of the stud are shown in Fig. 1.

4.3 *Upper Coupling Adaptor*—The apparatus is shown in Fig. 2. The adaptor is 3 3/4 in. (94 mm) long, 1 1/4 in. (31 mm) in diameter at the top, and 1 in. (25 mm) in diameter at the

FIG. 1 Direct Tensile Model

FIG. 2 Upper Coupling Adaptor

bottom. The hole, indicated by "B," is used to attach the adaptor to the tensile tester load cell. The hole has a 1/2 in. (13 mm) diameter. The machined opening indicated by "A," is to receive the head of the aluminum stud.

4.4 *Restraining Device*—The apparatus is shown in Fig. 3 A and 3 B. The 1/2-in. (13-mm) diameter hole, marked "A," in the 2 1/2-in. (63.5-mm) long, 1 1/4-in. (31-mm) diameter lower coupling adapter, is used to mount the device in the tensile tester. The top portion is 4 in. (100 mm) in diameter, 3/4 in. (19 mm) high, and is fitted with a hole slightly larger than 3/4 in. (19 mm) in diameter to allow stud clearance. The bottom screw portion is machined to fit with the top portion and is 1/2 in. (13 mm) thick. Fig. 3 C illustrates the final appearance of the test assembly before it is tested.

4.5 *Wooden Applicators*,⁴ used to clean the adhesive from around the aluminum stud.

¹ This test method is under the jurisdiction of ASTM Committee D-1 on Paints and Related Coatings and Materials and is the direct responsibility of Subcommittee D01.23 on Physical Properties of Applied Paint Films.

Current edition approved Nov. 18, 1991. Published December 1991.

² Gray, K. N., Buckley, S. E., and Nelson, G. L., "Assessing Measurement Standards for Coating Adhesion to Plastics" *Modern Paint and Coatings Journal*, Vol 75, No. 10, Oct. 1985, p. 160.

³ Tensile tester available from Instron Co., 100 Royall St., Canton, MA 02021, or equivalent, has been found satisfactory for this purpose.

⁴ Applicators, such as Puritan available from 6 in. (150 mm) in length and 0.07 in. (2 mm) in diameter, have been found to be satisfactory for this purpose.

FIG. 3 Direct Tensile Restraining Device

6. Adhesive, cyanoacrylate adhesive.⁵ Since cyanoacrylate adhesives lose adhesive bond strength with time, do not use previously opened containers or lots of adhesive known to be old.

7. Two-Kilogram Weight, approximately 2 in. (50 mm) diameter and 5 in. (130 mm) in height.

Preparation and Conditioning of Specimen

1. Sanding Procedure—Sand large face of stud with 60-grit sandpaper, making certain that the surface is uniformly roughened. When sanding studs, sand straight up and down; rotate stud one quarter of a turn and continue sanding. Make certain surface of stud is flat but rough. While sanding, keep stud face parallel to sandpaper. Non-planar faces cannot be used in testing because they lead to non-uniform bonding of the stud to the coated surface. Only (planar) studs should be used in testing. Planarity may be checked by placing a stud on a flat surface and checking to see if the stud wobbles. Careful preparation of studs is essential for good adhesive adhesion.

2. Cleaning Procedure—Place sanded studs in a large beaker. Pour technical grade acetone over the studs and swirl beaker to completely wash studs. Pour out acetone and repeat the cleaning procedure. Soak the stud for at least 15 min, pour out acetone, and allow studs to dry.

3. Place washed and dried studs and beaker in an oven at 100°C and allow to heat for 1 h. Remove the beaker and studs from the oven and allow to cool. DO NOT TOUCH FACE OF STUDS.

4. Spread four drops of cyanoacrylate adhesive on the large face of an aluminum stud. Next, quickly press the stud into the coated test substrate. Place a 2-kg weight on the stud to ensure good contact between the stud, adhesive, and surface of the coating. Clean the excess adhesive from the edge of the stud with a wooden applicator. Carefully remove the weight after 2 min.

NOTE 1—Substrate panels may be cut to any size that fits the restraining device.

NOTE 2—When the stud is pressed, excess adhesive should escape from under the stud. Excess adhesive buildup at the edge of the stud is a major source of error if allowed to dry. This excess must be removed from around the stud. The adhesive may be removed using a wooden applicator and an absorbent, creped, low-lint material.⁶ Some workers have found cotton swabs⁷ also work well when removing the excessive adhesive.

5.5 Allow the sample to cure for 2 h at room temperature.

NOTE 2—When reusing aluminum studs, the studs must be soaked in acetone to remove coating and resanded. It has been found that soaking the studs in two separate acetone baths thoroughly removes the adhesive and coating. The first acetone bath is used to dissolve the cyanoacrylate adhesive, and the second is used to further clean and dissolve any coating or adhesive left on the stud. Before the studs are used, they should be resanded and cleaned with acetone as specified in 5.2, 5.3, and 5.4.

5.6 Conditioning—Condition the coated substrates for at least 24 h at $23 \pm 2^\circ\text{C}$ ($73.5 \pm 3.5^\circ\text{F}$) and $50 \pm 5\%$ relative humidity, and test in the same environment or immediately on removal therefrom, unless otherwise specified by the purchaser and seller.

6. Procedure

6.1 Install the restraining device and upper adaptor in the tensile tester.

6.2 Calibrate the tensile tester. Make sure that the chart speed is set at 8 to 20 in./min (20 to 50 cm/min). Make sure that the crosshead speed is set at 2 in./min (5 cm/min). Make sure that the chart full scale is set at 100 kg.

6.3 Place the specimen to be tested in the restraining device (Fig. 3 A and 3 B). Pre-position the crosshead and then slowly lower it so the upper coupling adaptor can be attached to the test specimen. Take care to prevent the crosshead from impacting into the top of the specimen. Carefully attach the upper coupling adaptor to the stud (Fig. 3 C).

NOTE 3—When testing thin substrates, a piece of plastic may be placed in the restraining device behind the test specimen to prevent the

⁵ Cyanoacrylate adhesive such as Elmer's Wonder Bond Plus, or equivalent, has been found to be satisfactory for this purpose.

⁶ Kimwipes or equivalents, have been found satisfactory for this purpose.

⁷ Q-Tips or equivalents, have been found satisfactory for this purpose.

FIG. 4 Coating Adhesion Testing by Direct Tensile Methods

substrate from flexing when the stud is pulled from it.

6.4 Turn on the chart recorder and pen. Start the tensile test. Stop the test when the stress returns to zero on the chart.

6.5 Examine test area on each specimen to determine the type of coating failure, rating it according to the following:

- 6.5.1 Adhesive failure of the coating at the substrate, *A*,
- 6.5.2 Cohesive failure in the coating, *C*,
- 6.5.3 Combination of adhesive failure at the coating/substrate interface and cohesive failure in the coating, *AC*,
- 6.5.4 Adhesive failure at the stud, *S*, and
- 6.5.5 Combination of adhesive failure at the stud and cohesive failure in the coating, *CS*.

For multilayer coatings, note if the failure is between the layers. If so, label as *CM*.

6.6 Number and retain all test specimens for adhesion failure calculations. Test five specimens of each coated substrate one day and five on a second day. If one specimen differs significantly from the other four at the same time, fails because of an uneven (non-planar) stud, or for any other reason performs unlike the other four, test a replacement specimen.

NOTE 4—Examine the stud and specimen carefully. Adhesive should have been applied uniformly to the entire stud surface. Coating should have pulled off uniformly over the entire stud surface either with adhesive failure from the substrate (*A*) or cohesive failure in the coating (*C*). If failure is less than 90 % *A* or *C* or (*CM*), if the adhesive has failed at the stud, retest exercising particular care in the specimen and stud preparation.

NOTE 5—The percentage of adhesive failure at the coating/substrate interface is determined by inspecting the tested area on the substrate. This may be assessed by overlaying a transparent sheet grid marked in 0.10-in. (2.54 mm) squares and estimating the percentage of adhesive

failure in each square that lies over the tested area. These percentages may then be averaged to obtain failure for each specimen.

NOTE 6—Sample conditioning, if any, and humidity and temperature of test room may affect results. Notation of these conditions should be made on the test report.

7. Report:

7.1 Report the number of tests, the maximum stress obtained in each test, and the type of failure. Test data sheet is shown in Fig. 4. Fill in data sheet with results obtained from each test. Attach tensile test traces to the data sheets. Calculate and report mean and standard deviation for tensile strength for each coating/substrate combination tested.

8. Precision and Bias⁸

8.1 The precision and bias are primarily dependent upon the accuracy of the force measurements, the alignment of the device, the care exercised in stud and specimen preparation, and the care in testing.

8.2 A round robin involving five different types of coatings and seven different plastic substrates, and ten different laboratories yielded interlaboratory reproducibility data as shown in Table 1. Within laboratory repeatability data is shown in Tables 2 and 3.

9. Keywords

9.1 adhesion; bond strength; cyanoacrylate adhesive; plastic substrate; pull-off strength; pull testing; tensile tester

⁸ A complete report with additional data is available. See Nelson, G. L. "Testing of EMI/RFI Coating Adhesion to Plastics by a Tensile Test Method," Final Report for Computer and Business Manufacturers Association and Society of the Plastics Industry, University of Southern Mississippi, June, 1989.

TABLE 1 Overall Test Reproducibility

Note—This data was generated with lesser cautionary language than found in Note 2 and includes laboratories who had not removed excess adhesive. With experienced operators, reproducibility data can be anticipated to be better than shown in Table 1.

Ten Laboratories		
Sample	Kilogram Force	Standard Deviation
1	34.6	6.7

Standard Test Method for Abrasion Resistance of Printed Matter by the GA-CAT Comprehensive Abrasion Tester¹

This standard is issued under the fixed designation D 5181; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

Scope

1.1 This test method covers the procedure for determining abrasion resistance of printed matter using a GA-CAT Comprehensive Abrasion Tester.

1.2 This test method is applicable to packaging labels, book, catalog, and magazine covers, bar codes, corrugated boxes, and other containers having applied graphics on any substrate.

1.3 *This standard does not purport to address all of the safety problems, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

Referenced Documents

2.1 ASTM Standards:

E 171 Specification for Standard Atmospheres for Conditioning and Testing Materials²

Terminology

3.1 Definitions of Terms Specific to This Standard:

3.1.1 *abrasion resistance*—resistance against the act of scraping, smudging, or rubbing off.

3.1.2 *abrasiveness*—the degree to which a product tends to cause abrasion by the act of rubbing or scraping.

3.1.3 *receptor*—film or paper of standard abrasiveness onto which material removed from the specimen is deposited during the abrasion testing process. Alternatively, printed paper from which material is removed onto the specimen that has a higher degree of abrasiveness than the receptor (in case of testing abrasiveness).

4. Summary of Test Method

4.1 The test print and a receptor are sandwiched in the panel holder of the GA-CAT Comprehensive Abrasion Tester, clamped together with a known force, and made to slide over each other at a known frequency and over a known distance for a predetermined time period.

4.2 The test specimen is examined for degree of print degradation and the receptor for amount of ink or other material transferred from the specimen surface. Results may be rated relative to a comparative control run in the identical manner, or they may be quantified by comparison to a

ranking scale numbered from zero to ten (zero being the most abrasion resistant and ten the least abrasion resistant).

5. Significance and Use

5.1 Abrasion resistance during transport and storage is essential to prevent marring of type matter, designs, or protective coatings on the exterior of labels and other printed materials. Recognizing that the actual amount of abrasion occurring in the field depends on relative humidity, temperature, tightness of packing, and a host of other variables, this test method provides a rapid means for comparing the abrasion resistance of test surfaces under laboratory conditions. It is useful for specification acceptance between the supplier and the customer.

5.2 This test method can also be used to evaluate the relative abrasion resistance of printed inks, varnishes, laminates and substrates, and the abrasiveness of inks.

6. Apparatus

6.1 *GA-CAT Comprehensive Abrasion Tester*.³

6.2 *Ranking Book*,³ containing specimens whose degree of ruboff is ranked from 0 (no ruboff) to +10 (most ruboff).

7. Materials

7.1 *Standard Receptors*, approximately 4 by 4½ in. (102 by 114 mm), of an appropriate grade, as follows:

7.1.1 *C-1³ (least abrasive)*—Glossy coated paper suitable for use with samples of low abrasion resistance.

7.1.2 *A-1, A-3, and A-4^{3,4} (intermediate abrasiveness)*—Imperial lapping film with aluminum oxide abrasive particles of different sizes (9, 12, and 30 μ m, respectively).

7.1.3 *A-6^{3,4} (most abrasive)*, wet or dry, tri-um-it[®] 600.

7.1.4 *B-2³ (intermediate abrasion resistance)*—Printed single color paper suitable for measuring abrasiveness of samples of average abrasiveness (corrugated).

NOTE 1—Other receptors may be substituted provided they have equal abrasiveness on the same test specimens. Further research and experience may indicate a need for additional grades of standard receptors.

7.2 *Foam Sheet*,³ 2 pieces, each approximately 2 mm in thickness and cut to 4 by 4½ in. (102 by 114 mm).

NOTE 2—Use of foam sheeting as a backing for the test specimen and the receptor is recommended to provide uniform pressure over the test surfaces and to prevent ink, varnish, or other particles from becoming imbedded in the sensitive surface of the panel holders.

¹ This test method is under the jurisdiction of ASTM Committee D-1 on Paints and Related Coatings and Materials and is the direct responsibility of Subcommittee D01.56 on Printing Inks.

Current edition approved Oct. 15, 1991. Published December 1991.

² *Annual Book of ASTM Standards*, Vols 08.03 and 15.09.

³ Available from Gavarti Assoc., Ltd., 9240 N. Sleepy Hollow Lane, Milwaukee, WI 53217.

⁴ Available from 3M Co., St. Paul, MN 55119.

7.3 *Comparative Control*, a production or laboratory print preferably having known abrasion resistance. The comparative control must have the same substrate, color(s), and subject matter as the test print.

8. Test Specimen and Conditioning

8.1 The specimen size in the grain direction (or flute in the case of corrugated board) must not exceed 4½ in. (114 mm). The specimen size in the cross-grain direction is less critical; 4 in. (102 mm) is recommended. Care should be taken to avoid contaminating the test surface with fingerprints during specimen cutting and handling.

8.2 Condition the specimens at $73.5 \pm 3.6^\circ\text{F}$ ($23 \pm 2^\circ\text{C}$) and $50 \pm 5\%$ relative humidity in accordance with Specification E 171.

9. Preparation of Apparatus

9.1 Set the abrasion tester on a sturdy bench, preferably in a room conditioned at the temperature and relative humidity prescribed in 8.2. Make sure that the three-prong power cord is correctly connected.

9.2 Periodically, check the liquid level in the hydraulic pressure system. If not full, follow the instructions in the manufacturer's manual.

9.3 If test conditions have not been specified, select an appropriate receptor by running the reference standard for the length of time required to achieve a visible level of degradation. Start with receptor C-1 (7.1.1). If the test time exceeds 2 min, use a receptor with a higher level of abrasiveness.

NOTE 3—Excessively long rubbing times are to be avoided because they introduce uncontrollable heat development that can alter the results.

10. Procedure for Abrasion Testing

10.1 Loading the Instrument:

10.1.1 Move the tray containing the four panel holders to the front black support shelf. Make sure that the inscribed "L" appears on the upper left side of the left panel holder and the "R" in the upper right side of the right panel holder (see Fig. 1). There should be space of at least ½ in. between the two center panel holders.

10.1.2 Face the test specimen on the receptor (selected in 9.3) and sandwich between the foam sheets. Place the sandwich between the two center panel holders so that the

FIG. 1 Panel Holders

grain direction of the specimen is vertical. Take care that the sandwich does not extend below the bottom of the panel holders.

10.1.3 Push the four panel holders together into an upright parallel position. Make sure that the sandwich is not pinched at the bottom of the panel holders; otherwise, it will tend to slide down during the test. Grab the pins and move the tray inside the instrument so that the two retaining pins drop into the carriage holes. If the pins do not drop into their respective holes, recenter the panel holders on the sample tray.

10.1.4 Apply side pressure by turning the lower black spindle until the corresponding dial reads 20 pounds per square inch (psi). Do not apply top pressure at this time.

10.1.5 The carriage inside the instrument is meant to move between two limit switches (used for centering) approximately 2 in. (50.8 mm) apart. If the carriage is not situated between these limits, manually center the carriage.

10.2 Testing Under the Preset Mode:

10.2.1 Turn the power switch on by pressing the upper side of the flip switch at the right side of the instrument.

10.2.2 After the control box window (LCD) displays "GA-CAT ready," press CNTR; the LCD will read "check limits" to make sure the carriage is within the range of the limit switches. Press CNTR again and the LCD will read "release top pressure." Press CNTR once more and the carriage will move to the extreme right (limit switch) and then back to stop exactly in the center. At this point, the LCD will show that the carriage has been centered by showing a flashing square after "GA-CAT READY."

10.2.3 After the instrument is centered, apply the top pressure of 40 psi.

10.2.4 Push the "STRT" button. The LCD will read "computing" and after 3 s, the instrument will run under the following default values:

Time	5.0 s
Frequency	2.0 Hz
Span	1.0 in.
Offset	0.0 in.

10.2.5 When the instrument stops, release the top pressure, making sure that the top pressure plate is high enough to clear the panel holders. Push CNTR to re-center the carriage. Release the side pressure and pull the panel holders out of the carriage. Remove the sandwich and examine the test specimen and the receptor.

10.2.6 To continue running the test with the same settings, reload the instrument as in 10.1, apply the top pressure as in 10.2.3, and push STRT. When the instrument stops, follow the procedure in 10.2.5. Turn the switch off only at the conclusion of testing.

10.3 Changing the Default Values:

10.3.1 The default values may be changed to any of the following settings:

Time	Continuous from 1 to 3600 s
Frequency	0.2 to 3.0 Hz (cycles per s) with a resolution of 0.1 Hz
Span	0.1 to 1.9 in. with a resolution of 0.1 in.
Offset	0.1 to 0.4 in. (increments of 0.1 in.)

10.3.2 In order to change a setting, press the "mode" button until the LCD displays the default value to be altered. Enter the new value on the number buttons and then press "enter." The LCD will read "new value?". If the value is correct, press "enter" a second time. If incorrect, enter

other value or press "clear" and start over again.

NOTE 4—The instrument reverts to the original default values by pressing "reset" and any time the instrument is turned off.

10.3.3 When running thick samples such as corrugated material, follow the procedure in 10.1 through 10.2.1. If the center of the panel holders is not aligned with the center mark of the carriage, use the "offset" mode. Press the "mode" button until "offset" appears and then enter the new setting. A setting of 0.1 or 0.2 is recommended. An additional adjustment for overall width of the panel holders may also be necessary by removing one or two black separators.

10.3.4 Proceed further as in 10.2.2 until 10.2.6.

11. Interpretation of Results

11.1 Run the test material and the comparative control in the identical manner. Examine each print for degree of degradation and each receptor for amount of material transferred from the print. Report results for abrasion relative to the comparative control as equal, slightly or appreciably less, or slightly or appreciably greater.

11.2 A numerical record of degree of abrasion ranging from zero to ten can be obtained from a comparison of the test specimen with examples in the Ranking Book (6.2).

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 1916 Race St., Philadelphia, PA 19103.

12. Precision and Bias

12.1 *Precision*—An interlaboratory study of this test method was conducted in which operators in 17 laboratories tested six prints in triplicate on each of two days. The prints consisted of three density levels of two different colors and were ranked for abrasion resistance from 1.0 to 4.0. The within-laboratory pooled standard deviation was 0.54 at 15 df and the between-laboratories pooled standard deviation was 0.58 at 18 df. Based on statistical analysis of the results, the following criteria should be used for judging the acceptability of results at the 95 % confidence level:

12.1.1 *Repeatability*—Two results, each the mean of two determinations obtained by the same operator on different days, should be considered suspect if they differ by more than 1.5 ranking units.

12.1.2 *Reproducibility*—Two results, each the mean of results obtained on different days by operators in different laboratories, should be considered suspect if they differ by more than 2.2 ranking units.

12.2 *Bias*—Bias cannot be determined as there are no standard materials.

Standard Test Method for Determination of Volatile Organic Compounds (VOC) of Solvent Reducible Paints in Aerosol Cans¹

This standard is issued under the fixed designation D 5200; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This test method is for the determination of the volatile organic compounds of solvent-based paints in aerosol cans. It offers a unique way to obtain paint specimens from aerosol cans.

1.2 *This standard does not purport to address all of the safety problems, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use. A specific hazard statement is given in Note 1.*

2. Referenced Documents

2.1 ASTM Standards:

- E 145 Specification for Gravity-Convection and Forced-Ventilation Ovens²
- E 180 Practice for Determining the Precision of ASTM Methods for Analysis and Testing of Industrial Chemicals³

3. Summary of Test Method

3.1 A designated quantity from an aerosol coating is sprayed into an adapter glass tube assembly and heated in an oven at $110 \pm 5^\circ\text{C}$ for 60 min. The percent volatile is calculated from the loss in weight.

4. Significance and Use

4.1 This test method is the procedure of choice for determining volatiles in coatings for the purpose of calculating the volatile organic content in aerosols under specified test conditions. The inverse value, nonvolatile, is used to determine the weight percent solids content. This information is useful to the paint producer, user, and to environmental interests for determining the grams of volatile organic compounds per gram of solids emitted from aerosol cans.

5. Apparatus

5.1 Adapter Glass Tube Assembly, (Fig. 1).

5.1.1 *Sample Adapter Tube*, straight connecting with 35/25 spherical joints. Loosely fill with glass wool and

FIG. 1 Adapter Glass Tube Assembly

precondition for 30 min in an oven at $110 \pm 5^\circ\text{C}$ and store in a dessicator prior to use.⁴

5.1.2 *Charcoal Adapter Tube*, straight connecting with 35/25 spherical joints. Fill with activated charcoal and plug both ends with glass wool. This tube is used to prevent the solvent vapors from contaminating the vacuum pump.⁵

5.1.3 *Adapters*, connecting hose with 35/25 socket joints.⁶

5.1.4 *Adapter*,⁷ connecting hose with 35/25 ball joint.

5.1.5 *Clamps*, pinch type, with screw locking device.⁸

¹ This test method is under the jurisdiction of ASTM Committee D-01 on Paints and Related Coatings and Materials and is the direct responsibility of Subcommittee D01.21 on Chemical Analysis of Paints and Paint Materials.

Current edition approved Nov. 18, 1991. Published December 1991.

³ *Annual Book of ASTM Standards*, Vol 15.05.

⁴ Sample adapter tube, Catalog No. 5035-35, available from Ace Glass Inc., P.O. Box 688, 1430 Northwest Boulevard, Vineland, NJ 08360, has been found suitable for this purpose.

⁵ Charcoal adapter tube, Catalog No. 5035-3, available from Ace Glass Inc. has been found suitable for this purpose.

⁶ Adapters (socket joints), Catalog No. 5217-35, available from Ace Glass Inc. have been found suitable for this purpose.

⁷ Adapter (ball joint), Catalog No. 5216-35, available from Ace Glass Inc. has been found suitable for this purpose.

⁸ Clamps, Catalog No. 7669-14, available from Ace Glass Inc. have been found suitable for this purpose.

- 6 Glass Wool, medium fine silk.
- 7 Activated Charcoal, coconut, 8 to 12 mesh.
- 8 Tygon Tubing.
- 9 Iron Stands.
- 10 Utility Clamps.
- Vacuum Pump.
- Forced Draft Oven, Type II A or Type II B as specified in Specification E 145.
- Actuators (Valves), with extension tubes.
- Top Loading Balance, capable of weighing to 0.01 g.
- Shaker, similar to the Eberbach shaker in Fig. 2.

Procedure

- 1 Mix the aerosol can thoroughly using a shaker, similar to the Eberbach shaker in Fig. 2, for 15 min at the low speed setting. It is essential that the samples be well mixed to obtain valid results.
- 2 Weigh accurately to 0.01 g, a preconditioned sample adapter tube. Use a pair of gloves at all times when handling the adapter glass tube.
- 3 Remove the cap and actuator from the mixed can. Replace the actuator with one having an extension tube.
- 4 Test actuator and extension tube fit by spraying some contents out for about 5 s. This step also clears the dip tube to ensure a separation has occurred. If a leak is observed, replace with a better fitting actuator or extension tube.
- 5 Weigh the aerosol can with the actuator to the nearest 0.01 g. Spray 3 to 5 g of aerosol into the adapter tube assembly, spreading out the coating by moving the extension tube around the wall of the adapter tube. The spraying is done with the vacuum on.
- 6 Obtain the specimen weight by difference by weighing the aerosol can again to 0.01 g after spraying out the specimen.

FIG. 2 Aerosol Can on Eberbach Shaker

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 1916 Race St., Philadelphia, PA 19103.

6.7 Place the sample adapter tube in the drying oven for 60 min at $110 \pm 5^\circ\text{C}$.

NOTE 1: Warning—Provide adequate ventilation, consistent with accepted laboratory practice, to prevent solvent vapors from accumulating to a dangerous level.

6.8 Remove the adapter tubes from the oven, place immediately in a desiccator, cool to ambient temperature and weigh to 0.01 g.

7. Calculations

7.1 Calculate the percent nonvolatile NV, in the aerosol can as follows:

$$\text{NV, \%} = (W_2/W_1) \times 100 \quad (1)$$

where:

W_1 = weight of aerosol can before spraying sample minus weight of aerosol can after spraying sample, g, and
 W_2 = weight of sample adapter tube with solids minus weight of sample adapter tube, g.

7.2 The percent volatile organic compounds, VOC in the aerosol can may be calculated by the difference as follows:

$$\text{VOC, \%} = 100 - \text{NV} \quad (2)$$

where grams of VOC/grams of solid equal VOC/NV.

8. Precision and Bias

8.1 *Precision*—Estimates are based on an interlaboratory study in which 1 operator in each of 3 laboratories analyzed in duplicate on two different days 3 samples of solvent-based aerosol coatings containing 63.04 % to 77.53 % VOC. The coatings were commercially supplied. The results were analyzed statistically in accordance with Practice E 180. The within laboratory coefficient of variation was found to be 0.51 % relative at 9 df and the between laboratory coefficient of variation was 1.04 % relative at 6 df. Based on these coefficients the following criteria should be used for judging the acceptability of results at the 95 % confidence level:

8.1.1 *Repeatability*—Two results, each the mean of duplicate determinations obtained by the same operator on different days, should be considered suspect if they differ by more than 1.62 % relative.

8.1.2 *Reproducibility*—Two results, each the mean of duplicate determinations obtained by operators in different laboratories should be considered suspect if they differ by more than 3.59 %.

8.2 *Bias*—Bias has not been determined.

Standard Practice for Calculating Formulation Physical Constants of Paints and Coatings¹

This standard is issued under the fixed designation D 5201; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reappraisal. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reappraisal.

1. Scope

1.1 This practice describes procedures for calculating weight solids, volume solids, solvent content, and density of liquid paints and coatings based on formulation data (not from analytical determinations). These calculations may be related to either as-supplied (unreduced) or as-applied (reduced) coating materials, including multicomponent types.

1.2 These values may not be acceptable for regulatory purposes.

1.3 Calculated values for these physical constants are used in the coatings industry for developing lower volatile organic compound (VOC) paints, making comparisons, etc.

1.4 The calculations described in this practice are based on the following assumptions: (1) Solids (nonvolatile) content and density of the individual ingredients (raw materials or intermediates, or both) have been established by appropriate analytical methods (see Test Methods D 153, D 1475, D 2369, D 4558, and Guide D 2832), and (2) The blended formulation behaves as an ideal solution with no volume change on mixing (see 6.2).

1.5 In calculations involving the liquids in a formulation, those volatile liquids that are incorporated primarily for vehicle solvency and control of the application characteristics should be classified as *solvents*. This would include solvents normally used to adjust viscosity for application and appearance of the coating. Liquids that are expected to be retained in the dried film to affect the final performance properties should be classified as part of the coating solids.

NOTE 1—For regulatory VOC purposes, use EPA Reference Method 24 and ASTM standards listed, or state regulatory requirements (see EPA 450/3-88-018).

1.6 Volatile by-products of cross-linking reactions (cure volatiles) are not considered in these calculations since the object of this practice is to define paint physical constants based on formulation information.

EPA Federal Reference Method 24—Determination of Volatile Matter Content, Water Content, Density Volume Solids, and Weight Solids, of Surface Coatings⁵

3. Terminology

3.1 Description of Terms Specific to This Standard:

3.1.1 *formula density*—(see Test Method D 1475), the mass (weight in vacuum) of a unit volume of material at any given temperature.

3.1.1.1 DISCUSSION—In this practice, density is expressed in pounds per U.S. gallon (lb/gal) since this is commonly used in the coatings industry. Where dry materials are concerned, actual density (not bulk density) should be determined analytically or obtained from supplier information. Use Test Methods D 153 where applicable.

3.1.2 *formula percent volume solids content*—the calculated volume of nonvolatile material in a formula divided by the total volume of the paint material, times 100 %.

3.1.3 *formula percent weight solids content*—the calculated weight of nonvolatile material in a formula divided by the total weight of the coating material, times 100 %.

3.1.4 *formula solvent content*—the calculated weight of the solvents in a specific volume of paint (such as pounds of solvent per gallon of paint) based on formulation, which is determined by totalling all solvents present.

3.1.4.1 DISCUSSION—Volatile by-products of cross-linking reactions (cure volatiles) are not included in the formula solvent content. See Note 1 and applicable government regulations for definition of the term VOC.

3.1.5 *formula solvent density*—the calculated density of the combined solvent composition.

3.1.6 *formula VOC content*—calculated amount based

¹ This practice is under the jurisdiction of ASTM Committee D-1 on Paint and Related Coatings and Materials and is the direct responsibility of Subcommittee D01.24 on Physical Properties of Liquid Paints and Paint Materials.

⁴ Available from Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. Refer to EPA 450/3-88-018 dated December 1988. This protocol makes reference to the paint formulation physical constants for VOC and volume solids content.

⁵ Available from Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402.

on total formula solvent content, (such as pounds of solvent per gallon of paint) exclusive of water or solvents that are exempted by regulations. This is a theoretical value.

1.6.1 DISCUSSION—Solvent and VOC are not equivalent terms.

Significance and Use

5.1 Physical constants of paints and coatings are required for all aspects of their formulation, manufacture and use. This practice demonstrates standard methods agreed upon for calculating formulation values for some of these physical constants. The calculations are the same for either metric or U.S. customary units.

5.2 These formula values may not be used to replace measured values required by government regulations unless specifically stated in the governing documents.

Calculations

5.1 Formula Density (weight per unit volume):

5.1.1 The formula density (D_f) can be calculated from the total weight (W_f) and total volume (V_f) of the formulation. The formula volume can be calculated from the weight and density of each ingredient as given by the following equation:

$$D_f = \frac{W_f}{V_f} = \frac{W_1 + W_2 + \dots + W_n}{W_1/D_1 + W_2/D_2 + \dots + W_n/D_n} = \sum \frac{W_i}{W_i/D_i} \quad (1)$$

where:

- n = number of items in the formulation,
- D_f = formula density, lb/gal (g/L),
- W_f = total weight of formula, lb (g),
- V_f = total volume of formula, gal (L),
- W_i = weight of ingredient, lb (g), and
- D_i = density of ingredient.

5.1.1.1 An example would be as follows:

Ingredient	Weight W_i (lb)	Density D_i (lb/gal)	Volume V_i (gal)
	81.50	7.74	10.530
	6.10	7.90	0.772
	0.40	8.72	0.046
	<u>12.00</u>	<u>7.65</u>	<u>1.569</u>
Formula	100.00	D_f	12.917

Therefore, formula density, $D_f = \frac{100}{12.917} = 7.74$ lb/gal.

5.1.2 The density of any one of the ingredients in a product can be calculated as long as the density of the paint formulation and the other ingredients in that formulation are known ($D = W/V$), as in the following example:

Ingredient	Weight W_i (lb)	Density D_i (lb/gal)	Volume V_i (gal)
Polymer solids	50.00	D_{ps}	V_{ps}
Solvent A	25.00	6.95	3.60
Solvent B	<u>25.00</u>	<u>7.18</u>	<u>3.48</u>
Formula	100.00	7.50	V_f

where:

$$V_f = \text{volume of total formula, gal} = \frac{100.00}{7.50} = 13.3 \text{ gal,}$$

$$V_{ps} = \text{volume of polymer solids, gal} = 13.33 - (3.60 + 3.48) = 6.25 \text{ gal, and}$$

$$D_{ps} = \text{density of polymer solids, lb/gal} = \frac{50.00}{6.25} = 8.00 \text{ lb/gal.}$$

5.2 Formula Solvent (Volatile) Density:

5.2.1 The density of the solvent (volatile) portion can be calculated using the following equation:

$$D_s = \frac{V_1 D_1 + V_2 D_2 + V_3 D_3 + \dots + V_n D_n}{V_1 + V_2 + V_3 + \dots + V_n} = \sum \frac{V_i D_i}{V_i} \quad (2)$$

where:

- D_s = density of solid formula, lb/gal (g/L),
- V_i = volume of solvent, gal (L),
- D_i = density of solvent, lb/gal (g/L), and
- n = number of items in the formulation.

5.3 Formula Weight Percent Solids (Nonvolatile):

5.3.1 Calculate percent of solids by weight as follows:

$$S_w = \frac{\text{weight of solids}}{\text{total weight of coating}} \times 100 \quad (3)$$

where S_w = weight percent of solids (nonvolatile), %.

5.4 Formula Volume Percent Solids (Nonvolatile):

5.4.1 Calculate percent of solids by volume using either of the following equations depending on available information:

$$S_v = \frac{\text{volume of solids}}{\text{total volume of paint}} \times 100 \quad (4)$$

where S_v = volume percent of solids (nonvolatile), %.

or,

5.4.1.1 Generally the volume solids content is calculated by subtracting the volume of all solvent from the total volume since the volume of the solvent portion is usually more readily available than the volume of solid materials

$$S_v = \frac{\text{total volume of paint} - \text{volume of solvents}}{\text{total volume of paint}} \times 100 \quad (5)$$

where S_v = total volume percent of paint minus volume of solids.

5.4.2 When the volume solids of each ingredient in a formulation is known, the volume solids of the formulation can be calculated.

5.4.2.1 The volume (V_i) of each ingredient is calculated from the formula weight (W_i) of each ingredient divided by its density (D_i).

$$V_i = W_i/D_i \quad (6)$$

5.4.2.2 Total volume of the formula is determined by the sum of the volumes of the individual ingredients

$$V_f = \sum V_i \quad (7)$$

5.4.2.3 Formula volume solids (S_{vf}) is calculated in the following manner. The volume of each ingredient (V_i) is multiplied by the volume percent solids of that ingredient (S_{vi}) and the sum of these volume solids is divided by the total volume of the formula to give formula volume solids. This is shown symbolically as follows:

$$S_{vf} = \frac{\sum (S_{vi} \times V_i)}{V_f} \quad (8)$$

5.4.2.4 An example would be as follows:

Ingredient	Weight W, (lb)	Density D, (lb/gal)	Total Volume	Volume Solids, %	Volume of Solids
1	7.35	8.00	0.92	31.0	0.29
2	22.41	7.96	2.82	21.5	0.61
3	52.85	8.24	6.41	23.8	1.53
4	5.98	7.16	0.84	0.0	...
5	6.13	9.27	0.66	100.00	0.66
6	0.28	7.17	0.04	0.0	...
7	5.00	8.14	0.61	33.6	0.20
	100.00		12.30		3.29

$$V_s \% = \frac{\text{volume of solids, gal}}{\text{total volume, gal}} \times 100 \quad (9)$$

$$= \frac{3.29}{12.30} \times 100 = 26.7 \%$$

5.5 Formula Total Solvent Content and VOC Content (see 3.6):

5.5.1 If all of the solvent in the formulation is considered to be VOC for regulatory purposes, the VOC content may be expressed as pounds of VOC per gallon (grams per litre) of paint material, calculated as follows:

$$\text{VOC (lb/gal)} = \frac{(100 - \text{weight \% solids}) \times \text{density of coating}}{100} \quad (10)$$

5.5.2 If water is present in the paint material formulation, it must be subtracted from the total volatile portion in determining the formulation VOC content.

$$\text{VOC (lbs/gal) (less water)} = \frac{\text{weight of volatiles} - \text{weight of water}}{\text{volume of paint} - \text{volume of water}}$$

or,

$$= \frac{(100 - \text{weight percent of solids} - \text{weight percent of water}) \text{ formula density}}{100 - \frac{(\text{weight percent of water}) \text{ formula density}}{\text{water density}}} \quad (11)$$

where density equals pounds/gallon (grams per litre).

NOTE 2—Deduction for other non-VOC volatile ingredients as defined in local ordinances may be treated in a manner similar to water as just illustrated and in Practice D 3960.

NOTE 3—Solvent content and VOC content values may be converted from pounds per (U.S.) gallon (lb/gal) to grams per litre (g/L) by multiplying by 119.84.

5.6 Paints Reduced for Application:

5.6.1 The calculations and examples shown in 5.1 through 5.5 are for as-supplied materials intended for use without further reduction. The same calculations can be used for determining the formulation density, percent weight solids content, percent volume solids content, and solvent (VOC) content of materials that have been reduced for application. It is only necessary to know the amount of reduction (volume or weight) and the density of the reducing solvent. The reducing solvent then becomes an additional ingredient in the paint formulation.

5.6.2 Each of the following examples is based on the equation:

$$D = \frac{W}{V}$$

where:

D = density,

W = weight, and

V = volume.

5.6.2.1 Density of Reduced Material Knowing Percent Reduction by Volume:

(1) The paint material described in the example in 5.1.1.1 is reduced 20 % by volume with reducing thinner having a density of 7.20 lb/gal as follows:

	Volume, gal	Density, lb/gal	Weight, lb
Unreduced material	1.00	7.74	7.74
Reducing thinner	0.20	7.20	1.44

where (reducing thinner), weight = volume × density, or

$$W = 0.20 \times 7.20 = 1.44 \text{ lb.}$$

(2) The density of the reduced material is obtained by adding the volume and weight of each component, and dividing the total weight by the total volume:

	Volume, gal	Weight, lb
Unreduced material	1.00	7.74
Reducing thinner	0.20	1.44
	1.20	9.18

where density of reduced paint = $\frac{9.18}{1.20} = 7.65 \text{ lb/gal.}$

5.6.2.2 Formula Volume Solids of Reduced Paint Knowing Percent Reduction and Unreduced Volume Solids:

Using the information from the previous example and assuming an unreduced volume solids of 50 % and a volume reduction of 20 % thinner, the reduced formula volume solids content (S_{vr}) is calculated as follows:

	Volume, gal	Solids, gal
Unreduced material	1.00	0.50
Reducing thinner	0.20	0.00
	1.20	0.50

where formula volume solids, reduced = $\frac{0.50}{1.20} = 0.42 \text{ gal, or}$
 $S_{vr} = 42.0 \%$

6. Precision and Bias

6.1 No statement is made about either the precision or bias of this practice for calculating formulation physical constants since the results are obtained strictly by mathematical calculations and will be related to the accuracy of the data used and conformance to the prescribed calculations.

6.2 A bias toward slightly smaller volumes and higher densities may result from non-ideal solution behavior (see 1.3, (2)).

7. Keywords

Standard Test Method for Directional Reflectance Factor, 45-deg 0-deg, of Opaque Specimens by Broad-Band Filter Reflectometry¹

This standard is issued under the fixed designation E 97; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

This method has been approved for use by agencies of the Department of Defense and for listing in the DoD Index of Specifications and Standards.

1. Scope

1.1 This method covers the determination of the 45-deg, 0-deg directional reflectance factor of nonfluorescent opaque specimens by means of filter photometers. To obtain similar results from spectrophotometers, see Method E 308.

NOTE 1—The values stated in inch-pound units are to be regarded as the standard.

NOTE 2—This method has been developed for determining (1) the daylight luminous reflectance factor of paint, opaque white porcelain enamels, and ceramic whitewares; and (2) the blue-light reflectance factor (sometimes called "brightness") of uncolored papers and pulps in sheet form. The method may also be used for determining the reflectance factor of other opaque specimens.

NOTE 3—The blue-light reflectance factor of paper provides a measure of freedom from yellowness such as results in pulp and paper from the presence of lignin and other so-called impurities left by incomplete bleaching.

NOTE 4—Blue-light reflectance factor by this method differs slightly, both spectrally and geometrically from the TAPPI Standards T 217 and T 452. The TAPPI methods are considered to be standard for the pulp and paper industry when brightness measurements are to be made.

1.2 This standard may involve hazardous materials, operations, and equipment. This standard does not purport to address all of the safety problems associated with its use. It is the responsibility of whoever uses this standard to consult and establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

T 217 Brightness of Pulp

T 452 Brightness of Paper and Paper Board

3. Significance and Use

3.1 Measurements of reflectance factor provide a measure of the amount of incident radiation reflecting diffusely under the geometric conditions of this method. High values indicate low absorption. When the response of the detector conforms to the sensitivity of the average human eye (Y-tristimulus filter), the result is designated luminous reflectance. For near white specimens, the reflectance value for blue light (Z-tristimulus filter), provides a relative index of freedom from yellowness for a particular type of material.

3.2 This method is frequently used to evaluate near-white, diffusely reflecting materials such as paint, paper, and powders.

4. Terminology

4.1 *reflectance factor*—ratio of flux reflected from a specimen to the luminous flux reflected from a standard surface, under the same geometric conditions of measurement. Unless otherwise indicated, the standard surface is assumed to be a perfect reflecting diffuser. If some real surface is used, the quantity measured is called "relative reflectance factor."

4.2 *daylight 45-deg, 0-deg luminous directional reflectance factor*—the ratio of the luminous flux from a specimen illuminated at an angle of 45 deg and viewed perpendicularly by the equivalent of CIE standard source C and the 1931 CIE standard observer, to the luminous flux from the perfect reflecting diffuser, similarly illuminated and viewed (see Definitions E 284).

NOTE 5—The combination of illumination at 45-deg and viewing at 0-deg (perpendicularly), designated 45/0, or the converse designated 0/45, has been selected as being representative of average conditions of illuminating and viewing. This reflectance factor determines which of

⁵ Annual Book of ASTM Standards, Vol 14.02.

⁶ Available from Technical Association of the Pulp and Paper Industry, P.O. Box 105113 Atlanta, GA 30348.

specimens will appear lighter when viewed in daylight at an angle at which the observation of highlights is avoided.

5.3 blue-light 45-deg, 0-deg directional reflectance factor—the ratio of the light flux from the specimen illuminated at an angle of 45 deg by CIE standard source C, and viewed perpendicularly by a receptor whose response is equivalent to the $\bar{z}$ -function of the CIE standard observer, to the light flux from the perfect reflecting diffuser similarly illuminated and viewed (see Definitions E 284).

NOTE 6—CIE standard sources and functions are defined in Method D 585.

Apparatus

5.1 The apparatus shall consist of a reflectometer, either visual or photoelectric type, having source, filter, receptor, and design characteristics such that it will measure reflectance factors accurately to within 1.0 % of full-scale reading. The apparatus shall have the following characteristics:

5.1.1 Spectral Characteristics:

5.1.1.1 For Measurement of Daylight Luminous Reflectance Factor—The spectral energy distribution of the illuminator and the spectral sensitivity of the receptor, in combination, shall provide the equivalent of illumination by CIE standard source C and observation by the luminosity (y) function of the 1931 CIE standard observer.

NOTE 7—Spectral characteristics based on CIE standard illuminant D₆₅, or any other CIE daylight standard illuminant, or on the $\bar{y}$ function of the CIE 1964 supplementary standard observer (which is not the luminosity function) may be used as an alternative.

5.1.1.2 For Measurement of Blue-Light Reflectance Factor—The product of spectral energy of source, spectral transmission of filters, and spectral response of receptor shall be equivalent to the product of the $\bar{z}$ -function of the CIE standard observer multiplied by the energy distribution of CIE standard source C.

5.1.2 Geometric Characteristics—Illumination shall be within 4 deg of, and centered about, a single direction of 45 deg from the perpendicular to the test surface. It shall be effectively nonpolarized. Viewing shall be within 15 deg of, and centered about, the perpendicular.

NOTE 8—Any instrument that meets these apparatus specifications may be used. Instruments should also meet the precision requirements prescribed in Section 11. In general, commercial instruments do not conform exactly to the apparatus requirements. The suitability of a given instrument depends in large measure on the spectral selectivity of the specimens being measured, and on the availability of standards of similar reflectance and spectral character.⁷

6. Standards

6.1 Primary Standard—The primary standard for reflectance is the perfect reflecting diffuser as described in Definitions E 284. It is assigned a value of 100 for the conditions of 45-deg illumination and perpendicular view.

⁷ The names and addresses of manufacturers producing instruments for the measurement of reflectance are listed in *Optical Industry and Systems Directory*, available from Optical Publishing Co., Inc., P.O. Box 1146, Pittsfield, Mass. 01201.

6.2 Secondary Standards⁸—Porcelain-enameled metal plaques, or other materials known to be reasonably permanent in reflectance and uniform over the surface, may be calibrated and used as secondary reflectance standards.

7. Preparation of Test Specimens

7.1 Paint—Unless otherwise specified, prepare panels for the determination of reflectance factor by applying the paint to a suitable flat background with a doctor blade in accordance with Test Methods D 823. Use sufficient thickness so that additional coats produce no measurable change in reflectance factor. Allow 72 h for the paint to dry. It is recommended that 60-deg gloss as described in Test Method D 523 and unusual surface structure be noted.

7.2 Porcelain Enamel—Laboratory-prepared specimens, articles of commerce, or sections cut from articles of commerce may be tested. The area to be tested shall be flat and reasonably free of surface defects. Laboratory specimens shall be at least 60 by 90 mm (2½ by 3½ in.) in size; however, specimens 100 by 100 mm (4 by 4 in.) are preferred.

NOTE 9—The method of preparation of the specimen, such as weight of application or firing treatment, may affect the reflectance factor but is not a part of this test method; however, each manufacturer should investigate the effect of such variables on the reflectance factor of his products (see Test Method C 347).

7.3 Paper—Sample in accordance with Test Methods D 585. Handle the test specimen carefully to avoid soiling, and take care not to touch the areas to be tested. The test specimen shall consist of a pad of sheets sufficiently thick that doubling the number of sheets causes no measurable change in reflectance factor.

7.4 Other Materials—Prepare test specimens of materials other than those listed in 7.2 and 7.3 in accordance with accepted practice, and record the method of preparation in the report.

NOTE 10—All high-reflectance diffusely reflecting materials are somewhat translucent since most of their reflectance is due to internal scattering. Roughly 95 % of the incident light is transmitted through the surface, and partially absorbed. What is not absorbed is multiply scattered back to the surface, at a point different from the point of incidence, where it is retransmitted as reflected light. The maximum distance between the points of incidence and exitance is primarily a function of the extinction coefficient of the material. For materials such as most white paints and porcelain enamels, the extinction coefficient is large, and the maximum distance of travel is small, and errors due to this internal travel may be small enough to be neglected. Other high-reflectance materials, such as opal glass and white plastics, may have smaller extinction coefficients, and the maximum distance of internal travel may be large enough (several millimetres is not uncommon) that significant light losses can occur unless the reflectometer has been designed to eliminate such losses. The maximum errors occur in measurements of reflection factor when comparing sample and standard of markedly different extinction coefficients. See NBS Technical Note 594-12 (Oct. 1976) for a detailed discussion of such losses.

⁸ Secondary standards of porcelain enamel may be obtained from the Hunter Associates Laboratory, Inc., 11495 Sunset Hills Rd., Reston, Va. 22090, or the Gardner Laboratory Division of Pacific Scientific, P.O. Box 5728, Bethesda, Md. 20014. Other sources of standards may be obtained by writing to ASTM Headquarters.

8. Procedure

8.1 Operate the reflectometer in accordance with the instructions supplied by the manufacturer, including line voltage, warm-up time, and adjustment of the scale.

8.2 Use a standard having a reflectance factor close to that of the test specimen or, if several specimens having a small range of reflectance factor values are being tested, use at least two standards, preferably at the extremes of the range being measured. Use a green filter for luminous reflectance factor; a blue filter for blue-light reflectance factor of paper or other materials; and, when specified, other filters for reflectance factor for other kinds of light, such as an amber filter for amber-light reflectance factor, etc.

NOTE 11—In general, instrumental errors are related to the differences in reflectance factors and spectral characteristics between specimen and standard. For greatest accuracy, standards close in reflectance factor and similar in spectral characteristics to the specimens should be used. The same area of standard should be measured as that used for its calibration.

8.3 Obtain the instrument readings for the standards and then for the specimens, in turn; read the specimens in reverse order, and finally read the standards again.

8.3.1 *Paper Specimens*—Make readings with the blue filter on at least five separate sheets, and equal numbers of readings parallel to and at right angles to the machine direction of the paper on both sides of the sheets.

8.3.2 *Porcelain-Enameled Specimens*—Make reflectance factor readings with the green filter on an area not less than that of a circle 70 mm (2 7/8 in.) in diameter. A determination shall comprise a sufficient number of readings so that the average of successive determinations can be reproduced with a difference between the highest and lowest determinations, not exceeding 0.5 % on the scale for which the perfect reflecting diffuser is assigned a value of 100 (see 6.1). Instruments covering areas smaller than that prescribed may be used, provided a sufficient number of well-distributed readings is taken so that the average reflectance factor is determined within the spread prescribed for repeated determinations on a given specimen.

9. Calculation

9.1 Calculate the mean value for the readings on each standard and specimen.

9.2 Calculate the reflectance factor of each specimen according to the directions of the instrument manufacturer. Apply corrections for scale nonlinearity, if available. In the

absence of more explicit instructions, calculate the specimen reflectance factor as follows:

$$R = c \times (R_s/b)$$

where:

R = reflectance factor of the specimen for the filter used,
 c = mean instrument reading for the specimen,
 b = mean instrument reading for the standard used, and
 R_s = assigned reflectance factor of the standard for the filter used.

NOTE 12—The scale linearity of an instrument may be checked by reading the reflectance factors of a series of ten or more nonselective standards ranging from 85 to 0.5 %.⁸

10. Report

10.1 Report values of reflectance factor in percent relative to the perfect reflecting diffuser as 100 (as defined by U.S. National Bureau of Standards). The result is described as "45-deg, 0-deg directional reflectance factor." When the green filter is used, the words "daylight luminous" shall be inserted before "directional." When the blue or amber filters are used, the phrase "for blue light" or "for amber light," respectively, shall be added after "reflectance factor." Report reflectance factor values to the nearest 0.1 %. For paper specimens, report values for the wire and felt sides separately.

10.2 Describe or otherwise identify the method of preparing laboratory specimens.

10.3 Identify the reflectometer used by the manufacturer's name, the model, and the serial number.

11. Precision

11.1 *Precision (Repeatability and Reproducibility)*—Repeatability is the deviation from mean experienced when measuring a single specimen on a single instrument. Note that with many samples measured, excessive nonuniformity by area, or by method of presentation to the instrument, is the chief factor limiting repeatability. Reproducibility is the deviation from mean experienced between different instruments employing calibrated standards of nearly the same reflectance factor. Refer to Table 1.

TABLE 1 Precision Data^a

NOTE—All values refer to standard deviations.

Measurement	Reproducibility	Repeatability

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 1916 Race St., Philadelphia, PA 19103.

Standard Practice for Preparation of Pressed Powder White Reflectance Factor Transfer Standards for Hemispherical Geometry¹

This standard is issued under the fixed designation E 259; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

INTRODUCTION

The internationally accepted standard of reflectance is the perfect reflecting diffuser. This ideal reflecting surface reflects 100 % of the radiant power incident on it such that the radiance is the same for all directions within the hemisphere of solid angles. No physical realization of this standard exists. Optical properties of standards prepared from pressed plaques of magnesium carbonate (MgCO_3), barium sulfate (BaSO_4), or polytetrafluoroethylene (PTFE) can approximate those of this ideal standard. For further information see CIE Publication No. 46 (1).² The principal use of a white reflectance factor standard is to transfer an absolute scale of reflectance to a more durable material or from one instrument to another. In theory, this transfer, done from first principles, should be quite easy. In practice, values are likely to be required for parameters that are unknown, proprietary, or require a highly sophisticated level of skill. Some, but not all, of those parameters are discussed in this practice.

Scope

1.1 This practice covers procedures for preparing pressed powder transfer standards of reflectance factor. These standards can be used in the near-ultraviolet, visible and near-infrared region of the spectrum. Procedures for calibrating the reflectance factor of materials on an absolute basis are contained in CIE Publication No. 44 (2). Pressed powder standards are used as transfer standards for such calibrations because they have a high reflectance factor which is nearly constant with wavelength and because the distribution of reflected flux resembles that from the perfect reflecting diffuser.

1.2 This standard does not purport to address all of the safety problems, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

1.3 The values stated in SI units are to be regarded as the standard. The values in parentheses are for information only.

⁴ *Annual Book of ASTM Standards*, Vol 08.01.

D 4894 Specification for Polytetrafluoroethylene (PTFE) Granular Molding and Ram Extrusion Materials⁵

3. Terminology

3.1 *Definitions*—All terms used in this practice are consistent with Terminology E 284. The following three definitions are particularly important to this practice:

3.1.1 *reflectance*—the ratio of the flux reflected from a specimen to the flux incident on the specimen.

3.1.2 *perfect reflecting diffuser*—ideal reflecting surface that would neither absorb nor transmit light, but would reflect diffusely, with the radiance of the reflecting surface the same for all reflecting angles, regardless of the angular distribution of the incident light.

3.1.3 *reflectance factor*—the ratio of flux reflected from a specimen to the flux reflected from a standard surface, under the same geometric conditions of measurement. Unless otherwise indicated, the standard surface is assumed to be the perfect reflecting diffuser.

4. Summary of Practice

4.1 Procedures are given for the preparation of white reference standards of diffuse reflectance factor. The recommended materials are white powders that are pressed into plaques. These plaques provide close approximations to the optical properties of the perfect reflecting diffuser, and may be used to transfer a scale of absolute reflectance to another material or to an instrument.

4.2 Previous editions of this practice included guidelines for the preparation of standards from magnesium oxide smoke. Preparation of this type of standard is no longer recommended. The ease of preparation, physical ruggedness,

⁵ *Annual Book of ASTM Standards*, Vol 08.03.

and photometric stability of pressed powder plaques make them far superior to smoked magnesium oxide plaques as reflectance factor standards.

5. Significance and Use

5.1 All commercial reflectometers measure relative reflectance. The instrument reading is the reflectance factor, the ratio of the light reflected from a reference specimen to that reflected from a test specimen. That ratio is dependent on specific instrument parameters.

5.2 National standardizing laboratories and some research laboratories measure reflectance on instruments calibrated from basic principles, thereby establishing a scale of absolute reflectance as described in CIE Publication No. 44 (2). These measurements are sufficiently difficult that they are usually left to laboratories that specialize in them.

5.3 A standard that has been measured on an absolute scale could be used to transfer that scale to a reflectometer. While such procedures exist, the constraints placed on the mechanical properties restrict the suitability of some of the optical properties, especially those properties related to the geometric distribution of the reflected light. Thus, reflectance factor standards which are sufficiently rugged and cleanable to use as permanent transfer standards depart considerably from the perfect diffuser in the geometric distribution of reflected radiance.

5.4 The geometric distribution of reflected radiance from a pressed powder plaque is sufficiently diffuse so that such a standard can provide a dependable calibration of a directional-hemispherical reflectometer. Although pressed powder standards are subject to contamination and breakage, the directional-hemispherical reflectance factor of pressed powder standards can be sufficiently reproducible from specimen to specimen made from a given lot of powder, so as to allow one to assign absolute reflectance factor values to all the powder in a lot.

5.5 This practice describes how to prepare white reflectance factor standards from a powder in a manner that allows a standardizing laboratory to assign the absolute scale of reflectance to the powder.

6. Apparatus

6.1 The basic apparatus for producing a pressed powder standard includes a powder press, powder containers and a balance. There are presently two commercial suppliers of powder presses.⁶ The press and receptacles can also be made in a local machine shop. A suggested configuration is shown in Fig. 1. The optical surface of the plaque should be pressed against a surface of ground glass or poly(methyl methacrylate) to provide a matte finish on the pressed plaque. Powder receptacles should be at least 5 mm deep for BaSO₄ and at least 10 mm deep for PTFE.

8. Reagents and Materials

8.1 *Barium Sulfate*—the barium sulfate should be of the

⁶ Powder press conforming to ISO 2469 and DIN 5033 is available from Carl Zeiss Canada, Ltd., 45 Valleybrook Drive, Don Mills, Ontario M3B-2S6, Canada, Part Number 505866; and Technidyne Corporation, 100 Quality Avenue, New Albany, IN 47150-2272, Part Number 176601.

RECEPTACLE

NOTE—The collar and receptacle should be securely held in place before pressing the powder.

FIG. 1 Example Powder Press

highest purity. It should be specially refined for optical and spectroscopic use (3).⁷

8.2 *Polytetrafluoroethylene*—the PTFE (4)^{8,9,10} should also be specially refined for optical and spectroscopic use but some commercial grades have been found to be acceptable substitutes. There is currently no commercial source for small quantities of optical grade PTFE powder. Large quantities (drums) of commercial grade PTFE can be obtained from the manufacturers.

9. Procedure

9.1 All powdered reflectance standards should be stored in tightly capped glass containers. If the powder is purchased in plastic containers it should be transferred to a glass container as soon as possible. Before using the powder, it should be placed in a glass blender equipped with stainless-steel or PTFE-coated blades and pulverized to a uniform consistency. The quantity of powder to be used should be transferred with stainless steel or PTFE-coated spoons. The whole operation should be performed in a draft-free location, away from sources of small particulate contamination; filters, sweaters, windows, ovens, etc. All measurements (weight, height, width, depth, volume, area, etc.) should be performed with adequate precision to ensure that the final density is within 5 % of the specified value. The most reproducible standards are made by pressing the powder to a specific density. Thus, the mass of the powder to be used should be determined from the volume of the receptacle.

9.2 *Barium Sulfate*—BaSO₄ should be pressed to a density of 2000 kg/m³ (2.0 gm/cm³) and a thickness of at least 5 mm. Several specimens should be pressed in succession. Matched pairs should be selected to be representative of the contents of the bottle of powder. The pressed plaques should be kept in a covered desiccator when not in use. Some suppliers of BaSO₄ provide calibration values with each

use. PTFE can be very sensitive to particulate contamination and electro-statically attracts airborne particles. Such contamination can make the material slightly fluorescent and reduce its reflectance in the ultraviolet spectral region. Table 2 lists the 6°/diffuse reflectance factor values for PTFE as determined by the National Institute of Standards and Technology (NIST).

10. Precision and Bias

10.1 The National Institute of Standards and Technology and the Inter-Society Color Council Project Committee 22, Materials for Instrument Calibration, have carried out collaborative tests to determine the precision and bias of the preparation of PTFE reflectance factor standards (5). The standard deviation of three determinations of the reflectance factor of PTFE by the NIST ranged from 0.0002 to 0.0008 over the spectral range 300 to 1000 nm. The measured reflectances of PTFE from two manufacturers exhibited differences of from -0.002 to +0.004 over the same range with the largest differences near the ends of the range and a constant measurement uncertainty of ± 0.005. From the 9 laboratories participating in the round-robin experiment, 17 specimens were returned. The results are shown in Table 3 for the wavelength range 300 to 1000 nm.

10.2 CIE Publication Number 46 (6) cites literature references on the reproducibility of BaSO₄ pressings that range from 0.05 % to 1.0 % with the most common value in the range about 0.2 %. This puts the reproducibility of the plaque preparation near the level of the reproducibility of the international standardizing laboratories' ability to characterize the absolute reflectance of the material.

Standard Test Methods for Measurement of Gloss of High-Gloss Surfaces by Goniophotometry¹

This standard is issued under the fixed designation E 430; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

Scope

1.1 These test methods cover the measurement of the reflection characteristics responsible for the glossy appearance of high-gloss surfaces. Two test methods, A and B, are provided for evaluating such surface characteristics at specular angles of 30° and 20°, respectively. These test methods are not suitable for diffuse finish surfaces nor do they measure color, another appearance attribute.

1.2 As originally developed by Tingle and others (see Refs 1 and 2),² the test methods were applied only to bright metals. Recently they have been applied to high-gloss automotive finishes and other nonmetallic surfaces.

Terminology

3.1 Definitions:

3.1.1 Reflectance and Related Terms:

3.1.1.1 *reflectance, ρ , n* —ratio of the reflected radiant or luminous flux to the incident flux in the given conditions. (E 284)

(1) *Discussion*—The term *reflectance* is often used in a general sense or as an abbreviation for *reflectance factor*.

¹ These test methods are under the jurisdiction of ASTM Committee E-12 on Appearance of Materials and are the direct responsibility of Subcommittee E 12.03 on Geometry.

Current edition approved Aug. 15, 1991. Published November 1991. Originally published as E 430 - 71. Last previous edition E 430 - 78 (1983).

² The boldface numbers in parentheses refer to the list of references at the end of this method.

³ *Annual Book of ASTM Standards*, Vol 06.01.

⁴ *Annual Book of ASTM Standards*, Vol 08.02.

⁵ *Annual Book of ASTM Standards*, Vol 15.09.

⁶ *Annual Book of ASTM Standards*, Vol 14.02.

Such usage is not assumed in this method. The definition may require that the term be modified by adjectives denoting the spectral and geometric conditions of measurement.

3.1.1.2 *reflectance factor, R , n* —ratio of the flux reflected from the specimen to the flux reflected from the perfect reflecting diffuser under the same spectral and geometric conditions of measurement. (E 284)

3.1.1.3 *gloss reflectance factor, R_g , n* —ratio of the specularly reflected part of the (whole) flux reflected from the specimen to the flux reflected from a specified gloss standard under the same geometric and spectral conditions of measurement.

(1) *Discussion*—The gloss standard may be a black glass or a mirror, and may be assigned one of a variety of scale values G_s as specified. (E 284)

3.1.2 Gloss and Types of Gloss:

3.1.2.1 *gloss, n* —angular selectivity of reflected light, responsible for the degree to which reflected highlights or images of objects may be seen as superimposed on a surface. (E 284)

(1) *Discussion*—Gloss is responsible for the object's glossy appearance, not for an observer's perception of the appearance. At least six types or characteristics of gloss may be observed depending upon the character of the surface and the spatial distribution of the reflected light (3).

3.1.2.2 *specular gloss, n* —ratio of flux reflected in specular direction to incident flux for a specified angle of incidence and source and receptor angular apertures. (E 284)

3.1.2.3 *distinctness-of-image gloss, n* —aspect of gloss characterized by the sharpness of images of objects produced by reflection at a surface. (E 284)

3.1.2.4 *sheen, n* —the specular gloss at a large angle of incidence for an otherwise matte specimen. (The usual angle for measurement is 85°.) (E 284)

3.1.3 Terms Relating to Surface Characteristics:

3.1.3.1 *directionality, n —perceived*, the degree to which the appearance of a surface changes as the surface is rotated in its own plane, under fixed conditions of illumination and viewing. (E 284)

3.1.3.2 *texture, n* —the visible surface structure depending on the size and organization of small constituent parts of a material; typically, the surface structure of a woven fabric. (E 284)

3.1.4 Other Terms:

3.1.4.1 *aperture angle, 2θ , n* —angle subtended at a point on a specimen by the maximum dimension of the illuminator or receiver, within which the flux in a directional beam is contained.

(1) *Discussion*—In optics, the symbol θ is used for the

half angle; hence the recommended symbol here is 2_k (E 284)

3.1.4.2 *goniophotometer*, n —instrument that measures flux as a function of angles of illumination or observation. (E 284)

3.2 Terms Specific to This Test Method:

3.2.1 Terms Relating to Reflection Haze:

3.2.1.1 *reflection haze*, H , n —for a specified specular angle, ratio of flux reflected at a specified angle (or angles) from the specular direction to the flux similarly reflected at the specular angle by a specified gloss standard.

(1) *Discussion*—Modifiers may be used to specify the angles at which the haze is measured (for example, 2° or 5°); whether H or a logarithmic form is to be stated; or whether H is to be compensated for the luminance of the specimen by multiplication by Y_{specimen}/Y_n , where n denotes the reference white; or any combination of these.

3.2.2 Terms Relating to Metallic Reflection:

3.2.2.1 *metallic brightness*, n —freedom of a metal surface from diffuse haze or texture.

3.2.3 Terms Relating to Specimen Directionality:

3.2.3.1 *'with-machine' direction*, n —the axis of a specimen that is parallel to the direction of mill rolling or extrusion, or other surface-finish texture.

3.2.3.2 *'across-machine' direction*, n —the perpendicular to 'with-machine' direction.

3.3 Other appearance terms and definitions in Terminology E 284 are applicable to this test method.

4. Summary of Test Method

4.1 Several geometrically different measures of light reflected by a surface are proposed for use in describing its gloss appearance. In Test Method A, gloss reflectance factor is measured at 30° to the specimen normal using narrow illuminator and receiver aperture angles (0.5° wide maximum). Distinctness-of-image gloss is measured at 29.7° or 30.3° or both. Narrow-angle (2°) reflection haze is measured at 28 or 32° or both, and wide-angle (5°) reflection haze at 25 or 35° or both. The ratio of reflectance factors for 28 or 32° or both, perpendicular and parallel to the machine direction of the specimen, is computed as a measure of directionality. In Method B, specular gloss is measured at 20° according to Test Method D 523, and narrow-angle reflection haze is measured at 18.1 and 21.9° .

5. Significance and Use

5.1 The gloss of metallic finishes is important commercially on metals for automotive, architectural, and other uses where these metals undergo special finishing processes to produce the appearances desired. It is important for the end-products which use such finished metals that parts placed together have the same glossy appearance.

5.2 It is also important that automotive finishes and other high-gloss nonmetallic surfaces possess the desired finished appearance. The present method identifies by measurements important aspects of finishes. Those having identical sets of numbers normally have the same gloss characteristics. It usually requires more than one measurement to identify properly the glossy appearance of any finish (see Refs 3 and 4).

6. Apparatus

6.1 The apparatus shall be either an abridged goniophotometer (see Figs. 1A and 1B) or a full goniophotometer (see Fig. 2) that can be set to the specified specular, off-specular, and aperture angles given in Tables 1A and 1B. The abridged goniophotometer may have a fixed angle of incidence (for Test Method A, 30° ; for Test Method B, 20°) and specific fixed directions of view at which the flux from the specimen is measured (see Tables 1A and 1B).⁵

6.1.1 *Geometric Conditions for Test Method A*—The direction of incidence shall be 30° . The directions of view shall be opposite the direction of incidence at 30° deg for specular reflectance, 29.7 or 30.3° deg for distinctness of image comparisons, 28 or 32° deg for narrow-angle haze comparisons, and 25 or 35° deg for wide-angle haze comparisons. The angular dimensions of the mirror reflected image of the source slit in the plane of measurement and the angular dimensions of the receiver windows in this plane of measurement shall be as shown in Table 1A.

NOTE 1—The conventional notation indicating positive angles for incident conditions and negative angles for viewing conditions has been used, thus far, to reduce confusion. In the remaining sections, the negative notation is omitted, since only the viewing conditions are described.

6.1.2 *Geometric Conditions for Test Method B*—The direction of incidence shall be $20 \pm 0.1^\circ$. The directions of view shall be opposite the direction of incidence, at 20° for specular gloss measurement and at 18.1 and 21.9° for narrow-angle reflection haze measurement. The angular dimensions of the specularly reflected image of the source slit in the plane of measurement and the angular dimensions of the receiver windows in this plane of measurement shall be as shown in Table 1B.

6.1.3 *Spectral Conditions*—The measurement shall be made with visible light to give results in accordance with the CIE spectral luminous efficiency function $V(\lambda)$ (identical with $\bar{y}$) in the CIE 1931 standard observer) and CIE standard illuminant C (see Test Methods E 308 and E 1347). If another illuminant A, is used, this shall be specified in the report.

6.1.4 *Polarization*—The incident flux shall be unpolarized and the receiver shall be insensitive to the state of polarization of the reflected luminous flux.

6.1.5 *Clamp*—For Test Method A, a rotatable clamp of the type shown in Fig. 3 may be used for flattening and positioning the specimen during measurement.

7. Standards

7.1 Three calibrated standards of good planarity shall be available in either a set of metals or a set of nonmetals, depending upon which type of surface is measured.

7.2 High-Gloss Standards:

7.2.1 *High-Gloss Standard for Metals* shall be of aluminum, evaporated onto glass and covered with a protective coating of silicon monoxide, and calibrated for specular gloss and distinctness-of-image gloss.

7.2.2 *High-Gloss Standard for Nonmetals* shall be of highly polished black glass with a refractive index of approximately $n_D = 1.527$, calibrated for specular gloss and reflection haze, and assigned a scale value of $G_s = 89.4$ for a

FIG. 1A Optical Diagram of the Abridged Goniophotometer

ular angle of 30° (Test Method A) or $G_s = 89.2$ for a specular angle of 20° (Test Method B).

2—To determine the scale value, calculate the first-surface reflectance (Test Method D 2457, Section 5.1) for $n_D = 1.567$ at the specular angle of interest; for 30° it is 5.0436 % and for 20° it is 4.3769 %. Assign this a scale value of 100. (Test Method D 523, Section 5.1) Repeat the calculation for $n_D = 1.527$ and the same specular angle; the result for 30° is 4.5069 % and for 20°, 4.3769 %. The new scale value for 30° is $100 \times (4.5069/5.0436) = 89.4$, and for 20°, $100 \times (4.3769/4.3769) = 89.2$. (The latter value is also given in Test Method D 523.)

8. Intermediate Standards:

8.1 *Intermediate Standard for Metals* shall be of either chromium evaporated onto glass and covered with a protective coating of silicon monoxide, or of bright sheet aluminum with protective coating and calibrated for specular and distinctness-of-image gloss.

8.2 *Intermediate Standard for Nonmetals* shall be of a ceramic material, such as porcelain enamel on steel, and calibrated for specular gloss and distinctness-of-image gloss.

8.3 *Diffuse Standards* shall have a reflectance factor substantially constant over the angular range of the instrument.

8.4 *Care of Standards*—It is essential that the standards

be kept clean and free of scratches as well as from contact with contaminating materials. The cleaning method specified by the instrument manufacturer shall be followed and the standards should be checked at regular intervals against reference standards held in reserve.

8. Specimens

8.1 Specimens shall be obtained from test samples by selecting areas that are plane and representative of each sample being tested. Every specimen must be at least 2 3/4 in. (70 mm) in the smallest dimension. Specimens may be larger so long as it is possible to insert them and flatten them properly for measurement.

9. Preparation and Calibration of Apparatus

9.1 The instrument must be used in a clean dry area free of drafts. Standard laboratory conditions are recommended (see Section 2 of Specification E 171). Voltage regulation to ± 0.01 % must be incorporated in the instrument, or supplied separately. Follow manufacturer's recommendations for instrument warmup.

9.2 *Calibration*—Adjust the instrument to read the same

FIG. 1B Optical Diagram of the Apparatus for Method B

gloss reflectance factor for the intensity of light reflected from the diffuse standard through the specular, distinctness-of-image, and haze apertures. Adjust the instrument to read values of specular gloss and distinctness-of-image gloss assigned the aluminum mirror if metal surfaces are being measured; or the black gloss standard if nonmetal surfaces are being measured. If the instrument does not then read the appropriate intermediate standard within the limits set by the instrument manufacturer, refocus or recalibrate following the manufacturer's instructions.

10. Procedure

10.1 Bring the specimen to the instrument for measurement. Be sure the specimen is flat.

10.2 For Test Method A, be certain that the specular sensor is centered on the specimen-reflected specular light beam. One type of instrument, illustrated in Fig. 1A, provides for screw-controlled movement of the receptor assembly to achieve this centering. The full goniophotometer, shown in Fig. 2, identifies the specular direction by the peak of the goniophotometric curve.

10.3 Rotate the specimen in its own plane to find the orientation, giving the maximum specular signal. This specimen orientation is called the "machine direction" because it

generally coincides with the direction of travel of a sheet or film material through a processing machine.

10.4 Record the following quantities:

10.4.1 For Test Method A, readings of (a) gloss reflectance factor (specular gloss), $R_{s,30}$ at 30° ; (b) distinctness-of-image gloss; (c) 2° reflection haze, H_2 ; and (d) 5° reflection haze, H_5 . The quantities in (b), (c), and (d) may be either gloss reflectance factors or values of H , which are their ratios to the specular gloss reflectance factor recorded in (a).

10.4.2 For Test Method B, readings of (a) the 20° specular gloss, $R_{s,20}$; (b) the reflection haze, H ; and (c) the luminous reflectance, Y .

10.5 Measure at least three areas of each specimen.

10.6 From these same areas, read 2-deg haze for the "across-machine direction," being careful to flatten the test surface and orient the specular beam in each case.

10.7 Take readings on the standards at the end of the series of observations to ensure that the instrument has remained in calibration throughout the operation.

11. Calculation

11.1 For Test Method A, calculate the mean of three readings for each specimen for:

11.1.1 Specular gloss, $R_{s,30}$, at 30° .

11.1.2 Distinctness-of-image gloss, $100 \times (1 - H_{0.3})$, evaluated at 0.3° on either or both sides of the specular angle.

11.1.3 2° Reflection haze, $100 H_2$, evaluated at 2° on either or both sides of the specular angle.

11.1.4 5° Reflection haze, $100 H_5$, evaluated at 5° on either or both sides of the specular angle.

11.1.5 Directionality, $100 \times (H_{2, \text{across-machine}} / H_{2, \text{with-machine}})$, evaluated at 2° on either or both sides of the specular angle.

11.2 For Test Method B, calculate the mean of three readings of each specimen for:

11.2.1 Specular gloss, $R_{s,20}$ at 20° .

11.2.2 One or more of the following, as required:

11.2.2.1 Reflection haze, H_{20} .

11.2.2.2 Logarithmic reflection haze, $H_{20, \log} = 1285 \log[(H_{20}/20) + 1]$.

11.2.2.3 Compensated reflection haze, $H_{20, \text{comp}} = H_{20, \text{specimen}} - (H_{20, n} \times Y_{\text{specimen}} / Y_n)$.

NOTE 3— $H_{20, \log}$ may also be calculated as a compensated quantity by using $H_{20, \text{comp}}$ in place of H_{20} in 11.2.2.2. Compensated quantities shall be used when comparing specimens with different values of Y .

12. Report

12.1 The report for Test Method A shall contain the following:

12.1.1 The specular gloss $R_{s,30}$.

12.1.2 The distinctness-of-image gloss.

12.1.3 The 2° haze, H_2 .

12.1.4 The 5° reflection haze, H_5 .

12.1.5 The directionality.

12.2 The report for Test Method B shall contain the following:

12.2.1 The specular gloss $R_{s,20}$.

12.2.2 Either the logarithmic reflection haze or the compensated logarithmic reflection haze.

12.3 The report for both methods shall contain the following:

12.3.1 Identification of instrument used by model and serial number.

Standard Test Method for Abrasion Resistance of Pipeline Coatings¹

This standard is issued under the fixed designation G 6; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This method of accelerated test is a procedure for determining the relative resistance of steel pipeline coatings to abrasion by a slurry of coarse abrasive and water. The method is intended to apply to the testing of all types of electrical insulating pipeline coatings and tapes, including thermoplastics, thermoset, and bituminous materials.

1.2 Pipeline coatings are not normally subjected to the type of abrasion herein specified.

1.3 Metallic protective coatings such as zinc may be compared visually, but do not meet the electrical requirements of this test method.

1.4 *This test method may involve hazardous operations and equipment. This test method does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of this test method to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

1.5 The values stated in SI units to three significant decimals are to be regarded as the standard.

2. Referenced Documents

2.1 ASTM Standards:

- G 12 Test Method for Nondestructive Measurement of Film Thickness of Pipeline Coatings on Steel²
- G 62 Test Methods for Holiday Detection in Pipeline Coatings³

3. Definition

3.1 *holidays*—small faults or pinholes which permit current drainage through protective coatings on steel pipe.

4. Summary of Test Method

4.1 Apparatus and materials are described whereby coatings on steel pipe are worn away by an abrasive slurry contained in a horizontally revolving drum. Specimens extend through both ends of the drum and are electrically insulated from contact with the test apparatus.

4.2 Periodic measurement of the electrical resistance between the specimen and the drum indicates the degree of

abrasion resistance of the coating.

5. Significance and Use

5.1 This procedure defines a test method for comparing the relative resistance of pipeline coatings to abrasion.

5.2 Abrasion resistance may be used to specify optimum coating thickness of candidate materials both in development and research work to study new coating systems or methods and in quality control.

6. Apparatus

6.1 *Drum*—A cylindrical steel container suitable for testing nine specimens simultaneously. Figures 1 to 3 show construction details which may be altered at the cap assembly if desired. A valve shall be provided to release any pressure built up during test.

6.2 *Apparatus for Revolving the Drum*—Any suitable apparatus used to revolve the drum at 30.48 m (100 linear ft)/min. A modified jar rolling mill³ has been found satisfactory for revolving the drum.

6.3 *Thickness Gage*, to be used in accordance with Method G 12.

6.4 *Holiday Detectors*, low-voltage wet-sponge type for thin film coatings (coatings thinner than 20 mils), and high-voltage type for thick film coatings (coatings thicker than 20 mils).

NOTE 1—Low voltage detectors are used to locate pinholes, voids, or thin spots in pipeline coatings. The potential used with wet-sponge detectors can be up to 100 V DC. Procedures for using these detectors are found in Method A of G 62. For use of high voltage detectors operating in the 900 to 20 000 Vdc range, see Method B of G 62.

6.5 *Volt-ohm-meter*—Any electrical test instrument for measuring electrical resistance of the circuit.

7. Reagents and Materials

7.1 The test slurry shall consist of the following:

- 7.1.1 *Aluminum Oxide Grit*,⁴ 13.6 kg (30 lb).
- 7.1.2 *Tap Water*, 5.68 L (1½ gal).

8. Test Specimen

8.1 A 19.1 mm test specimen 406 mm (16 in.) long shall be prepared with its surface preparation and coating procedures equivalent to that of production coated pipe. Only holiday-free specimens, in duplicate, shall be used in this test.

¹ This test method is under the jurisdiction of ASTM Committee G-3 on Durability of Nonmetallic Materials and is the direct responsibility of Subcommittee G03.06 on Durability of Pipeline Coatings and Linings.

Current edition approved May 27, 1988. Published July 1988. Originally published as G 6 - 69 T. Last previous edition G 6 - 83.

8.2 Control specimens shall be included in each test, the selection of which is optional with the user.

9. Conditioning

9.1 The specimen shall be exposed to a room temperature of 21° to 25°C (70° to 77°F) for a period of 24 h before beginning the test.

10. Procedure

10.1 Perform the test at a room temperature of 21° to 25°C (70° to 77°F).

10.2 Measure and record the coating thickness of each specimen in accordance with Method G 12.

10.3 Check all specimens or holidays using an appropriate detector.

10.4 Position the specimens in the drum taking care not to damage the coating.

10.5 Load the apparatus with 13.6 kg (30 lb) of unused abrasive and 5.68 L (1½ gal) of water.

10.6 Test each specimen for electrical resistance after sealing the drum by using the volt-ohm-meter. Immerse the specimen in the slurry at the time the electrical resistance is measured. Reject and replace any specimen showing less than infinite resistance.

10.7 Revolve the drum at the rate of 30.5 m (100 linear ft)/min.

10.8 Determine the electrical resistance at 25-h intervals for a test period of 200 h.

10.9 Relieve the pressure built up during the test by opening the release valve each time the electrical resistance is measured.

11. Report

11.1 The report shall include the following:

11.1.1 Complete identification of test specimens, including name and code number of coating, size of the pipe, production date, production run number, and any other information that may be pertinent to identification,

11.1.2 Date of starting and of terminating the test,

11.1.3 Coating thickness of the test specimen before testing and minimum coating thickness after testing,

11.1.4 Volt-ohm-meter readings at 25-h intervals, and

11.1.5 Description of coating appearance after testing.

12. Precision

12.1 Precision data are limited to two adjacent specimens taken from the same production-coated pipe, assuming that the production process was uniform with respect to pipe

surface condition and coating material. Specimens that were not adjacent in the as-produced condition, or were taken from different lengths of pipe may represent differing process conditions.

12.2 Repeatability—When more than one test of the same coating material is involved, the standard deviation of the results should not be greater than 1.0 times the hourly time interval between inspections for the specific coating material. The standard deviation⁵ of a set of numbers is the square root of the average of the squares of the deviations of the numbers from their average. The standard deviation of two or more specimen results may be found by the following

procedure:

$$\text{Standard deviation, } \sigma = 1/n[(n\sum X^2 - (\sum X)^2)^{1/2}]$$

where:

- $\sum X$ = sum of all values of X , from X_1 to X_n inclusive,
- n = number of observed values (observations), and
- σ = standard deviation, the root-mean-square (rms) deviation of the observed values from their average.

12.3 Reproducibility—Agreement between laboratories should be such that the standard deviation of the results for a specific coating should not be greater than 1.5 times the inspection time interval.

⁵ For more information see the *ASTM Manual on Presentation of Data and Control Chart Analysis*, STP 15D, October 1976.

Standard Test Methods for Cathodic Disbonding of Pipeline Coatings¹

This standard is issued under the fixed designation G 8; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 These test methods cover accelerated procedures for simultaneously determining comparative characteristics of insulating coating systems applied to steel pipe exterior for the purpose of preventing or mitigating corrosion that may occur in underground service where the pipe will be in contact with inland soils and may or may not receive cathodic protection. They are intended for use with samples of coated pipe taken from commercial production and are applicable to such samples when the coating is characterized by function as an electrical barrier.

1.2 This test method is intended for testing coatings submerged or immersed in the test solution at room temperature. When it is impractical to submerge or immerse the test specimen, Test Method G 95 may be considered where the test cell is cemented to the surface of the coated pipe specimen. If higher temperatures are required, see Test Method G 42. If a specific test method is required with no options, see Test Method G 80.

1.3 The values stated in SI units to 3 significant decimals are to be regarded as the standard.

1.4 *This standard does not purport to address all of the safety problems associated with its use. It is the responsibility of whoever uses this standard to consult and establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

2. Referenced Documents

G 12 Test Method for Nondestructive Measurement of Film Thickness of Pipeline Coatings on Steel²

G 42 Method for Cathodic Disbonding of Pipeline Coatings Subjected to Elevated Temperatures²

G 80 Test Method for Specific Cathodic Disbonding of Pipeline Coatings³

G 95 Test Method for Cathodic Disbondment Test of Pipeline Coatings (Attached Cell Method)³

3. Summary of Test Methods

3.1 Both of the two test methods described subject the coating on the test specimen to electrical stress in a highly conductive, alkaline electrolyte. Electrical stress is obtained either by means of a sacrificial magnesium anode or from an

impressed current system. The coating is perforated before starting the test.

3.1.1 In Method A, a magnesium anode is used with no electrical monitoring during the test period. The results are determined by physical examination after the test period is concluded.

3.1.2 In Method B, either a magnesium anode or an impressed current system may be used. Electrical instrumentation is provided for measuring the current in the cell circuit. The electrical potential is also measured, and upon conclusion of the test period, the test specimen is physically examined.

3.1.3 In both test methods physical examination is conducted by comparing the extent of loosened or disbonded coating at the perforations in the immersed area with extent of loosened or disbonded coating at a new test hole in the coating made in an area that was not immersed.

4. Significance and Use

4.1 Breaks or holidays in pipe coatings may expose the pipe to possible corrosion, since after a pipe has been installed underground, the surrounding earth will be more or less moisture-bearing and it constitutes an effective electrolyte. Damage to pipe coating is almost unavoidable during transportation and construction. Normal soil potentials as well as applied cathodic protection potentials may cause loosening of the coating, beginning at holiday edges, in some cases increasing the apparent size of the holiday. Holidays may also be caused by such potentials. While apparently loosened coating and cathodic holidays may not result in corrosion, this test provides accelerated conditions for loosening to occur and therefore gives a measure of resistance of coatings to this type of action.

4.2 The effects of the test may be evaluated by either physical examination or monitoring the current drawn by the test specimen or both of these two. Usually there is no correlation between the two methods of evaluation but both methods are significant. Traditional physical examination consists of assessing the effective contact of the coating with the metal surface in terms of observed differences in the relative adhesive bond. It is usually found that the electrically stressed area propagates from the holiday to a boundary where the loosened coating leaves off for the more effective contact or bond attributed to an original condition throughout the specimen before electrical stressing was applied. Assumptions associated with test results include the following:

4.2.1 Attempting to loosen or disbond the coating at a new test hole made in the coating in an area that was not immersed represents maximum adhesion or bond as measured by the lifting technique used, and that the same lifting

¹ These test methods are under the jurisdiction of ASTM Committee G-3 on Durability of Nonmetallic Materials and are the direct responsibility of Subcommittee G03.06 on Durability of Pipeline Coatings and Linings.

Current edition approved May 25, 1990. Published July 1990. Originally published as G 8 - 69 T. Last previous edition G 8 - 85.

² Annual Book of ASTM Standards, Vols 06.01 and 14.02.

³ Annual Book of ASTM Standards, Vol 14.02.

NOTE—Test hole made in non-immersed area after testing not shown (see Fig. 5).

FIG. 1 Test Assembly for Method A Using a Magnesium Anode

technique can be used at a test hole that was immersed thereby providing a means of comparing relative resistance to lifting.

4.2.2 Any relatively lesser bonded area at the immersed test holes in the coating was caused by electrical stressing and was not attributable to an anomaly in the application process. Ability to resist disbondment is a desired quality on a comparative basis, but disbondment per se in this test is not necessarily an adverse indication. The virtue of this test is that all dielectric type coatings now in common use will disbond to some degree thus providing a means of comparing one coating with another. Bond strength is more important for proper functioning of some coatings than others and the same measured disbondment for two different coating systems may not represent equivalent loss of corrosion protection.

4.2.3 The amount of current in the test cell is a relative indicator of the extent of areas requiring protection against corrosion; however, the current density appearing in this test is much greater than that usually required for cathodic protection in natural, inland soil environments.

5. Apparatus

5.1 Apparatus for Both Methods:

5.1.1 *Test Vessel*—A nonconducting material shall be used for the vessel or as a lining in a metallic vessel.

Dimensions of the vessel shall permit the following requirements:

5.1.1.1 Test specimens shall be suspended vertically in the vessel with at least 25.4-mm (1-in.) clearance from the bottom.

5.1.1.2 Each test specimen shall be separated from the other specimens, from the anodes and from the walls of the test vessel by at least 38.1 mm (1.500 in.).

5.1.1.3 Depth of electrolyte shall permit the test length of the specimen to be immersed as required in 7.4.

5.1.1.4 If electrical monitoring is to be performed as required in Method B, the reference electrode may be placed anywhere in the vessel, provided it is separated from the specimen and from the anode by not less than 38.1 mm (1.500 in.).

5.1.2 *Magnesium Anode*—The anode shall be made of a magnesium alloy having a solution potential of -1.45 to -1.55 V with respect to a CuCuSO_4 reference electrode in the electrolyte given in 6.1. It shall have a surface area not less than one third that of the total specimen area exposed to electrolyte (outside area exposed only). The anode shall be provided with a factory-sealed, 4107-cmil (14-gage Awg), minimum, insulated copper wire. Anodes without a factory seal may be used if the magnesium extends above the cover.

5.1.3 *Connectors*—Wiring from anode to test specimen shall be 4107-cmil (14-gage Awg), minimum, insulated copper. Attachment to the test specimen shall be by sol-

FIG. 2 Test Assembly for Method B Using a Magnesium Anode

dering, brazing, or bolting to the nonimmersed end, and the place of attachment shall be coated with an insulating material. A junction in the connecting wire is permitted, provided that it is made by means of a bolted pair of terminal lugs soldered or mechanically crimped to clean wire ends.

5.1.4 *Holiday Tools*—Holidays shall be made with con-

ventional drills of the required diameter. For use in preparing small-diameter pipe specimens such as 19.05 mm (0.750 in.) nominal diameter pipe, the use of a drill modified by substantially grinding away the sharp cone point has been found effective in preventing perforation of the metal wall of the pipe. A sharp-pointed knife with a safe handle is required for use in making physical examinations.

5.1.5 *High-Resistance Voltmeter*, for direct current, having an internal resistance of not less than 10 MΩ and having a range from 0.01 to 5 V for measuring potential to the reference electrode.

5.1.6 *Reference Electrode*, saturated CuCuSO_4 of conventional glass or plastic tube with porous plug construction, preferably not over 19.05 mm (0.750 in.) in diameter, having a potential of -0.316 V with respect to the standard hydrogen electrode. A calomel electrode may be used, but measurements made with it shall be converted to the CuCuSO_4 reference for reporting by adding -0.072 V to the observed reading.

5.1.7 *Thickness Gage*, for measuring coating thickness in accordance with Test Method G 12.

5.1.8 *Thermometer*, for measuring electrolyte temperature, general lab type, 1° subdivisions, 76.2 mm (3 in.) immersion.

5.2 *Additional Apparatus for Method B:*

5.2.1 *High-Resistance Voltmeter*, for direct current, having an internal resistance of not less than 10 MΩ and capable of measuring as low as $10 \mu\text{V}$ potential drop across a shunt in the test cell circuit.

5.2.2 *Precision Wire-Wound Resistor*, $1\text{-}\Omega \pm 1\%$, 1-W (minimum), to be used in the test cell circuit as a shunt for current.

5.2.3 *Volt-Ohm-Meter*, for initial testing of apparent coating resistance.

5.2.4 *Metallic Electrode*, used temporarily with the volt-ohm-meter to determine apparent initial holiday status of the test specimen.

5.2.5 *Additional Connecting Wires*, 4107-cmil (14-gage

(wg), minimum, insulated copper.

5.2.6 *Brass Studs*, used at a terminal board, together with alligator clips or knife switches, for making and breaking circuits. Alligator clips shall not be used to connect to electrodes or specimens at the top location of test cells.

5.2.7 *Zero-Resistance Ammeter*, capable of measuring direct current as low as 10 μ A may be used in the alternative method given in 9.1.3 and substituted for the apparatus described in 5.2.1 and 5.2.2.

5.2.8 *Direct-Current Rectifier*, capable of supplying constant voltage at a voltage of 1.50 ± 0.01 V, as measured between the specimen and reference electrode.

5.2.9 *Impressed Current Anode*, shall be of the nonconsumable type provided with a factory sealed, insulated copper wire.⁴

5.2.10 *Voltage Divider*, 100-Ω, 25-W rheostat, to be used if more than one specimen is to be tested as shown in Fig. 4.

6. Reagent and Materials

6.1 The electrolyte shall consist of potable tap water with the addition of 1 mass % of each of the following technical-grade salts, calculated on an anhydrous basis: sodium chloride, sodium sulfate, and sodium carbonate. Use freshly prepared solution for each test.

6.2 Materials for sealing the ends of coated pipe specimens may consist of bituminous products, wax, epoxy, or other materials, including molded elastomeric or plastic end caps.

⁴ Durion, a material found suitable for this purpose is available from Durion Co., Inc., Dayton OH.

6.3 Plywood or plastic material has been found suitable for the construction of test vessel covers and for the support through apertures of test specimens and electrodes. Wood dowels introduced through holes in the top ends of test specimens have been found suitable for suspending test specimens from the vessel cover.

7. Test Specimen

7.1 The test specimen shall be a representative piece of production-coated pipe. One end shall be plugged or capped, and sealed.

7.2 One or three holidays shall be made in each specimen. Three holidays are recommended. Recommended dimensions are given in Fig. 5. A specimen with one holiday shall have it drilled in the middle of the immersed length. If three holidays are used, they shall be drilled 120° apart with one in the center and the other two at locations one fourth the distance from top and bottom of the immersed test length. Each holiday shall be drilled so that the angular cone point of the drill will fully enter the steel where the cylindrical portion of the drill meets the steel surface. The drill diameter shall be not less than three times the coating thickness, but it shall never be smaller than 6.35 mm (0.250 in.) in diameter. The steel wall of the pipe shall not be perforated. With small-diameter pipes, where there is danger of perforating the pipe, the holiday shall be started with a standard 60° cone point and finished with a drill that has had a substantial portion of the cone point ground away.

NOTE 1—Before making the holiday, see 8.1.

7.3 The end of the pipe which will protrude above the

FIG. 5 Recommended Dimensions for Specimen

immersion line shall be provided with suitable supporting means and a separate wire connection for electrical purposes, soldered, brazed, or bolted to the pipe. The protruding end, including hanger and wire connections, shall be protected and sealed with an insulating coating material.

7.4 The specimen test area shall consist of the area between the edge of the bottom end seal and the immersion line. The bottom end seal area shall not be considered part of the area tested. Any suitable diameter and specimen length of pipe may be used, but the immersed area shall be not less than 23 227 mm² (36 in.²). An area of 92 900 mm² (1 ft²) has been found preferable when convenient.

8. Specimen Preparation

8.1 Before making artificial holidays, verify the continuity of the coating and the effectiveness of the end-cap seal as follows:

8.1.1 Immerse the test specimen and a metallic electrode in the electrolyte. Connect one terminal of the multimeter to the test specimen and the other terminal to the metallic

electrode. Measure the apparent resistance in ohms, making two determinations: one with the specimen connected to the positive terminal of the multimeter; and one with the specimen connected to the negative terminal.

8.1.2 Disconnect the specimen from the multimeter but leave it immersed for 15 min. Then, measure the resistance again as in 8.1.1.

8.1.3 A significant decrease in either resistance reading after 15-min will indicate a flaw in the coating or end-cap seal. Reject the specimen if the flaw is identified in the coating. If the flaw is in the end-cap seal, it may be repaired and the resistance remeasured as in 8.1.1 and 8.1.2.

8.1.4 The lowest resistance after 15 min of immersion shall be not less than 1000 M Ω but a stable reading below 1000 M Ω may not indicate a flaw and the specimen may be used for test. All resistance measurements shall be reported in the results.

8.2 Record initial holiday diameter(s).

8.3 Measure and record the minimum and maximum coating thickness in accordance with Method G 12, and the

FIG. 6 Suggested Form, Part I, for Use in Presenting Data for One Specimen Method A and Method B

where each holiday is made.

Procedure for Method A

Immerse the test specimen in the electrolyte and connect to the anode as shown in Fig. 1. Position the test specimen so that it faces away from the anode. Connect the anode with respect to test specimens as described in Fig. 1. Mark the correct immersion level of the test specimen with a grease pencil and maintain by daily addition of potable water as required. Perform the test at a temperature of 21 to 25°C (70 to 77°F). In order to ascertain that the test cell is functioning, measure the potential between test specimen and a reference electrode immediately after starting the test and immediately terminating it. Use temporary connections and instrumentation, as shown in Fig. 1. The potential measured shall

be -1.45 V to -1.55 V with respect to a CuCuSO₄ reference electrode. Use the instrument described in 5.1.5.

9.2 Duration of the test period shall be 30 days. Optionally, other test periods such as 60 or 90 days may be used.

9.3 An examination shall be performed immediately upon termination of the test period as follows:

9.3.1 At the end of the test period, disassemble the cell and rinse the test area with warm tap water. Immediately wipe the sample dry and visually examine the entire test area for any evidence of unintentional holidays and loosening of coating at the edge of all holidays, including the intentional holiday, and record coating condition, for example, color, blisters, cracking, crazing, adhering deposits, etc.

9.3.2 Drill a new reference holiday in the coating in an area that was not immersed. Follow the same drilling procedure as described in 7.2.

Initial Ohms +

[illegible]

9.3.3 Make radial 45° cuts through the coating intersecting at the center of both the intentional holiday and the reference holiday with a sharp, thin-bladed knife. Take care to ensure that coating is cut completely through to the steel substrate.

9.3.4 Attempt to lift the coating at both the reference holiday and the intentional holiday with the point of a sharp, thin-bladed knife. Use the bond at the reference holiday as a reference for judging the quality of the bond at the intentional holiday. Measure and record the total area of disbonded coating at the intentional holiday.

NOTE 2—The use of a transparent film having a grid laid out in small squares such as 2.54 mm (0.1 in.) on a side has been found useful. The film is placed against the unsealed area and the boundary of the unsealed area traced on the grid. The area is then obtained by counting the squares within the bonded area.

10.1 In addition to the procedure given in Section 9, monitor the progress of the test electrically in accordance with the schedule given in 10.2 as follows:

10.1.1 If a magnesium anode is to be used, install the test assembly shown in Fig. 2. If impressed current for a single specimen is to be used, install the test assembly shown in Fig. 3; if more than one specimen is to be tested, use the modification shown in Fig. 4.

10.1.2 Measure E_2 , the stress potential in volts between test specimen and reference electrode, with a multimeter without disconnecting the anode from the test specimen. Use the instrument described in 5.1.5. If a CuCuSO_4 electrode is used, immerse only temporarily.

10.1.3 Measure I_1 , the current demand in amperes, by

determining the potential drop across the 1- Ω resistor permanently installed in the test cell circuit with the multimeter described in 5.2.1. The voltage reading will be numerically equal to amperes.

NOTE 3—An alternative method of measuring current demand may be used by means of the instrument described in 5.2.4. In this method, the wire connection between test specimen and anode is temporarily broken and a zero-resistance ammeter temporarily interposed between the specimen and the anode. Reconnect the specimen to the anode with the connector wire as soon as this measurement is completed.

10.1.4 Measure E_1 , the polarized potential, in volts. Do this with the multimeter described in 5.1.5 connected between the test specimen and the reference electrode as follows:

10.1.4.1 Disconnect the anode from the test specimen while closely observing the multimeter. As the instrument pointer falls, it will dwell significantly at the polarized value before receding further. The dwell point is E_p . If a CuCuSO_4 electrode is used, immerse only temporarily.

10.2 Electrical Monitoring Schedule:

10.2.1 Electrical measurements at the start of the test are defined as the average of measurements taken on the second and third days after immersion. Measurements may be taken on the day of immersion in order to ascertain functioning of the test cell, but such measurements are not to be used in calculating the change in characteristics from start to target dates in the conduct of the test.

10.2.2 Make electrical measurements at the start of a test and on a target date after 30 days. The test may be continued for 60 or 90-day targets with intermediate and corresponding electrical measurements.

10.2.3 Take electrical measurements for intermediate

get dates and for the terminal date on 2 successive days for to and including the target date. The average of readings taken on the 2 days is defined as the target date measurement.

10.2.4 Rectifier current shall be continuous. Any interruptions must be reported.

Report (see Figs. 6 and 7):

11.1 The report for Method A shall include the following:

11.1.1 Complete identification of the test specimen, including:

11.1.1.1 Name and code number of the coating,

11.1.1.2 Size and wall thickness of pipe,

11.1.1.3 Source, production date, and production run number,

11.1.1.4 Minimum-maximum coating thickness, average thickness and the thickness at the holiday,

11.1.1.5 Immersed area,

11.1.1.6 Size and number of initial holidays, and

11.1.1.7 Resistance measurements verifying continuity of the coating and effectiveness of the end cap seal as required in 8.1.

11.1.2 Dates of starting and terminating test.

11.1.3 Tally of areas that have been found unsealed on the terminal date. Areas may be reported in square millimetres (square inches) or millimetres (inches) of equivalent circle diameter of the area, or both. If more than one holiday was used, the area per holiday may be reported as an average.

NOTE 4—Equivalent Circle Diameter (*ECD*) is obtained from the formula:

$$ECD = (A/0.785)^{1/2}$$

where:

A = area of holiday, mm^2 (in.^2)

11.1.4 Other information that may be pertinent.

11.2 The report for Method B shall include the following:

11.2.1 The data required in the report for Method A,

11.2.2 The relative resistances of the test specimen in ohms before the artificial holiday was made as described in 11.4, and

11.2.3 The results of starting, intermediate, and terminal electrical measurements. Report the following measurements:

11.2.3.1 Current demand in microamperes, or negative

characteristic of the logarithm of the current in amperes, or both,

11.2.3.2 The value of $\Delta E = E_2 - E_1$ in volts, and

11.2.3.3 Change from start to termination for values 11.2.3.1 and 11.2.3.2. If more than one holiday was used the average change per holiday may be reported for 11.2.3.1.

11.2.4 Any interrupted time of the rectifier current.

12. Precision and Bias

12.1 Precision data are limited to two adjacent specimens taken from the same production-coated pipe and assume that the production process was uniform with respect to pipe surface condition and coating material. Specimens that were not adjacent in the as-produced condition or were taken from different lengths of pipe may represent differing process conditions. The following data should be used for judging the acceptability of results: (These precision data are approximations based on limited data, but they provide a reasonable basis for judging the significance of results.)

12.2 Method A:

12.2.1 Repeatability—Duplicate results by the same worker should not be considered suspect unless they differ by more than 12.7 mm (0.5 in.) in value *ECD* in accordance with the following equation:

$$ECD = (A/0.785)^{1/2}$$

where:

A = unsealed area developed from 1 artificial holiday, mm^2 (in.^2).

12.2.2 Reproducibility—The results reported by one laboratory should not be considered suspect unless they differ from those of another laboratory by more than 25 mm (1 in.) for value *ECD* in the equation given in 12.2.1.

12.3 Method B:

12.3.1 Repeatability—Duplicate results by the same worker should not be considered suspect unless they differ by more than unity in the negative characteristic of the logarithm of the current demand in amperes.

12.3.2 Reproducibility—The results reported by one laboratory should not be considered suspect unless they differ from those of another laboratory by more than unity in the negative characteristic of the logarithm of the current demand in amperes.

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 1916 Race St., Philadelphia, PA 19103.

Standard Test Method for Water Penetration into Pipeline Coatings¹

This standard is issued under the fixed designation G 9; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This method covers the determination of the apparent rate of depth of water penetration into insulating coatings applied to pipe.

1.2 The values stated in inch-pound units are to be regarded as the standard.

1.3 *This standard may involve hazardous materials, operations, and equipment. This standard does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

2. Referenced Document

2.1 *ASTM Standard:*

G12 Test Method for Nondestructive Measurement of Film Thickness of Pipeline Coatings on Steel²

3. Summary of Method

3.1 The method consists of an immersion-type test where pipe specimens are suspended in an aqueous electrolyte for the duration of the test period. Electrical measurements of coating capacitance and dissipation factor are used to follow the water absorption rate of the test materials.

4. Significance and Use

4.1 The deterioration of an insulating coating film is intimately related to its moisture content. The water penetration test provides a means for monitoring the passage of moisture through a coating material by means of changes in its dielectric constant. When expressed in relation to time, the test data will reflect a rate of deterioration which is a characteristic of the coating material and will bear a relation to its expected useful life as an insulating coating. The test for water penetration will also provide information that is useful in establishing the optimum coating thickness for a given material.

5. Apparatus

5.1 *Immersion Cell*—Any suitable nonmetallic vessel to contain the test specimens. Dimensions of the vessel shall permit the following requirements:

5.1.1 Test specimens shall be suspended vertically with at least 25 mm (1.0 in.) clearance from the sides and bottom.

5.1.2 Test specimens shall be separated by not less than 25 to 40 mm (1 to 1.5 in.) and a vertically suspended anode shall be placed at an equal distance from each specimen not less than the separation of distance.

5.1.3 The test vessel shall be deep enough to allow for immersion of the samples in the electrolyte to the level specified in 8.1.

NOTE 1—Commercially available, glass battery jars in 2-dm³ (0.55-gal) and 10-dm³ (2.7-gal) sizes can be conveniently used with 19-mm (0.75-in.) and 51-mm (2.0-in. nominal) diameter specimens, respectively.

5.1.4 A suitable sample support plate fabricated from a material having a low dielectric constant shall be used to suspend the samples and anode above the immersion cell. The support plate shall contain an access hole for the reference electrode. A typical test cell is illustrated in Fig. 1.

5.2 *Electrolyte*, consisting of tap water with the addition of 1 weight % of each of the following technical-grade anhydrous salts: sodium chloride, sodium sulfate, and sodium carbonate.

NOTE 2—Add 30 g (1.05 oz) of sodium chloride for each dm³ (0.26 gal) of water.

5.2.1 The electrolyte in the immersion cell shall be maintained at the proper level by regular additions of tap water. The electrolyte shall not be reused after completion of the test.

5.3 *Voltage Source*—A direct current power supply, capable of supplying low ripple voltage shall be used to maintain a potential difference of 6.0 ± 0.1 V dc between each of the test specimens and a common electrode.

5.4 *Connectors*—Wiring connections from the anode to the specimen shall be of No. 18 AWG insulated copper. Attachment to the anode shall be sealed and kept above the level of the electrolyte. Attachment to the specimen shall be made by a method that will allow disconnection from the anode when the measuring bridge is in use. A convenient means for accomplishing this is through the use of insulated pin-type jacks.

5.5 *Capacitance Bridge*³—Measurements of equivalent specimen capacitance and coating dissipation factor shall be made with a low-voltage a-c, resistive-ratio-arm type measuring bridge having the following characteristics:

5.5.1 Oscillator frequency, 1 kHz $\pm$ 2 %,

5.5.2 Series capacitance range, 1 to 1100 pF $\pm$ 1 %,

5.5.3 Series capacitance sensitivity, 0.5 pF,

5.5.4 Dissipation factor range, 0.001 to 1.0 at 1 kHz, and

5.5.5 Dissipation factor sensitivity, 0.001 at 1 kHz.

¹ This method is under the jurisdiction of ASTM Committee G-3 on Durability of Nonmetallic Materials and is the direct responsibility of Subcommittee G03.06 on Durability of Pipeline Coatings and Linings.

Current edition approved May 29, 1987. Published July 1987. Originally published as G 9 - 69 T. Last previous edition G 9 - 82.

² *Annual Book of ASTM Standards*, Vols 06.01 and 14.02.

³ A bridge found to meet the requirements specified is the General Model 1656 Impedance Bridge, GenRad, Concord, MA 01742.

FIG. 1 Typical Test Cell

5.6 *Measuring Circuit*—Measurements of specimen capacitance and coating dissipation factor shall be made using a circuit that places the sample unknown in series with the

comparison circuit of the measuring bridge. Connection of the unknown to the measuring bridge shall be made in such a manner as to eliminate the introduction of stray capacitance into the measuring circuit. A diagram for connecting the test cell to the bridge is shown in Fig. 2. In this arrangement, both the test leads are shielded and the chassis of the bridge is grounded. The immersion cell shall also be shielded to avoid capacitance effects from surrounding objects.

NOTE 3—A shield for the test cell can conveniently be fabricated from most commercially-available tin or aluminum foils of approximately 0.0382-mm (0.0015-in.) thickness and formed around the container.

5.7 *Thickness Gage*—Measurements of coating thickness will be required for this test. Any instrument suitable for use with Test Method G 12 can be used.

5.8 *Anode*, fabricated from 4.76-mm (0.1875-in.) diameter AISI Type 303 stainless-steel rod, and shall be 178 mm (7.00 in.) long, with the upper 50 mm (2.00 in.) threaded to accept a locking nut.

6. Test Specimen

6.1 The test specimen shall be a representative piece of production-coated pipe and shall be free of obvious coating flaws or defects (see Fig. 3). Any suitable diameter and specimen length can be used. Physical limitations of the immersion cells suggested in 5.1.3, Note 1, make it necessary to restrict the over-all sample length to approximately 300 mm (12.0 in.) for both the 26.7-mm (0.75-in. nominal) and 60.3-mm (2.0-in. nominal) diameter coated pipe specimens.

6.2 The upper and lower ends of the test specimen shall be plugged and sealed with nonconductive caps of sufficient bulk to minimize effectively capacitive end effects in the measuring circuit. For this purpose, an end-cap thickness of

FIG. 3. Detail Drawing of Pipe Specimen

13 mm (0.5 in.) to 19 mm (0.75 in.) shall be maintained.

6.2.1 The end-cap material shall have a dielectric constant in the range from 2 to 6, bond well to the coating surface, and exhibit a low water-absorption rate. Several commercially available poly(vinyl chloride)-paraffin compounds,⁴ well suited for this purpose. They have a melting point in the 150 to 200°C (300 to 390°F) range, can be poured into molds around the pipe sample, and appear as resilient, malleable solids at room temperature.

NOTE 4—Using these materials, the end-caps can be applied to the required thickness by repeated dipping of the sample ends into a molten-wax bath, or through the use of light-weight, disposable molds of aluminum foil or paper formed around the pipe sample to allow the pressing of the caps directly to the surface of the coated pipe sample.

6.3 The end of the specimen which will protrude above the immersion line shall be provided with a suitable means of support and a separate wire connection for electrical purposes. The protruding end of the sample shall be waterproofed with a thin coating of end-cap material (see Fig. 1).

Preliminary Test Measurements

7.1 *Coating Thickness*—Measure and record the coating thickness by referring to Method G 12.

7.2 *Specimen Length*—Measure and record the length of exposed coating surface, between the end caps.

7.3 *End-Cap Capacitance*—Vertically suspend the test specimens and anode in the immersion cell, observing the clearances specified in 5.1.1 through 5.1.3. Fill the container with the electrolyte until it just covers the lower end cap.

* A material found suitable for this purpose is Boler Petroleum No. L-480-86 Blend, Boler Petroleum Co. 85 Old Eagle School Rd., Wayne, PA 19087.

Energize the impedance bridge and measure the series capacitance, C_c of the lower end cap.

7.4 *Initial Coating Capacitance*—Add additional electrolyte to the immersion cell until its level reaches the lower edge of the upper end cap. Immediately measure and record the initial series capacitance, C_0 , and dissipation factor, DF , of the specimen.

8. Procedure

8.1 Energize each specimen by connecting it to the negative side of the voltage source. Keep each sample energized and immersed to the lower edge of the upper end cap for the duration of the test period. Maintain the specified electrolyte level through regular additions of tap water.

8.2 Throughout the test make periodic measurements of the series capacitance and dissipation factor of the immersed specimens in the following manner:

8.2.1 Temporarily disconnect the test specimen from the voltage source. Verify that the electrolyte is at the proper level within the immersion cell. Connect the measuring bridge between the test specimen and stainless-steel anode. Energize the bridge and measure the series capacitance, C , and dissipation factor, DF , of the test specimen.

8.2.2 Using the observed value of series capacitance, C_s , calculate the apparent depth of water penetration by the method described in 9.2.

8.2.3 Repeat the measurements of series capacitance and specimen dissipation factor at periodic intervals throughout the duration of the test. The frequency of measurement will depend upon the rate of deterioration of the coating sample. Where the water penetration process is relatively rapid, daily readings of sample capacitance and dissipation factor will be required. Normally, readings made at weekly intervals will adequately define the penetration rate.

NOTE 5—Some coatings exhibit an initial rise in capacitance and dissipation factor, but reach a state of equilibrium in 6 to 9 months. An increase in capacitance and dissipation factor following this period of equilibrium, (or failure to reach equilibrium) indicates impending failure. A sample can be considered to have failed when the dissipation factor reaches a value of 1.0.

9. Calculations

9.1 *Dielectric Constant*—Calculate the dielectric constant, K_0 , for the coating film as follows:

$$K_0 = \frac{(C_0 - C_c) \ln [(2t_0 + d)/d]}{NL}$$

where:

K_0 = dielectric constant,

C_0 = initial coating capacitance, pF,

C_c = end-cap capacitance, pF,

d = outside pipe diameter, mm (in.),

t_0 = initial coating thickness, mm (in.),

L = exposed coating length, mm (in.), and

$N = 0.0556$ when d , t_0 , L , are in mm (1.413 when d , t_0 , L , are in in.).

9.2 *Apparent Depth of Penetration*—Calculate the depth of water penetration by applying the calculated value of K_0 from 9.1 and the measured value of equivalent series capacitance, C , to the following equations:

$$t_p = t_0 - t$$

$$t = (d/2)[(e^M) - 1]$$

where:

$M = NK_0 L / (C - C_0)$,

t = unpenetrated coating thickness, mm (in.),

C = series capacitance, pF, and

t_p = depth of penetration, mm (in.).

10. Report

10.1 The report shall include the following:

10.1.1 Complete identification of specimen, including:

10.1.1.1 Name and code number of the coating,

10.1.1.2 Size of pipe,

10.1.1.3 Source, production date, and production-run number,

10.1.1.4 Minimum, maximum, and average coating thickness,

10.1.1.5 Dates of starting and terminating test, and

10.1.1.6 Other information that may be pertinent,

10.1.2 Magnitude and polarity of d-c voltage applied to sample during the test period,

10.1.3 Length of the test period in days,

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 1916 Race St., Philadelphia, PA 19103.

10.1.4 Apparent depth of water penetration for the test period indicated,

10.1.5 Initial value of coating dissipation factor, and

10.1.6 Value of coating dissipation factor at the end of the test period.

NOTE 6—For the purpose of monitoring coating performance, plotted graphs of apparent depth of water penetration versus time in rectangular coordinates and coating dissipation factor versus time in semilogarithmic coordinates will render useful information over the duration of the test period.

11. Precision

11.1 Due to the range of coating formulations, thicknesses, densities, etc., found among commercially available coated pipe samples, the overall accuracy and reproducibility of the test results by these methods will tend to be poorer than those expected on insulating material of a more uniform nature.

11.2 The precision (reproducibility) of the dissipation factor and depth of penetration by these methods in general is considered to be such that when two tests are performed consecutively on the same specimen under identical conditions, the difference between the two results may normally be expected not to exceed $\pm 5\%$ of their mean.

Standard Test Method for Specific Bendability of Pipeline Coatings¹

This standard is issued under the fixed designation G 10; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

Scope

- 1.1 This method covers the specific determination of the effect of short-radius bends on coatings applied to 33.4-mm (1-in. nominal) diameter pipe.
- 1.2 *This standard may involve hazardous operations and equipment. This standard does not purport to address all of the safety problems associated with its use. It is the responsibility of whoever uses this practice to consult and establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*
- 1.3 The values stated in SI units to three significant decimals are to be regarded as the standard.

Referenced Documents

- 2.1 *ASTM Standards:*
- G 6 Test Method for Abrasion Resistance of Pipeline Coatings²
- G 12 Test Method for Nondestructive Measurement of Film Thickness of Pipeline Coatings on Steel²

Summary of Method

3.1 The method consists of bending a 33.4-mm (1-in. nominal) diameter specimen of coated pipe around a mandrel to produce a range of short-radius bends. Coating failure in the form of cracking or loss of adhesion is detected through visual and electrical inspection of the bent specimen.

Significance and Use

4.1 This test will provide information on the ability of coatings applied to pipe to resist cracking, disbonding, or other mechanical damage as a result of bending. Because the test is applied to coated pipe from commercial production, the results can be directly used in the selection of similar materials for service. The test also has application as a quality control method when variations in coating application or material formulation will affect bending performance.

5. Apparatus

5.1 The bending apparatus shall be essentially as shown in Figs. 1 to 3 and shall include the following:

- 5.1.1 *Variable-Radius Mandrel*, constructed from four 19-mm (0.75-in.) thick pieces of plywood, bolted together and conforming to the geometric shape shown in Fig. 1. The

geometric construction is accomplished by laying out along the outer edge of the mandrel a series of seven consecutive arcs at decreasing radii of 610, 530, 460, 380, 300, and 230 mm (24, 21, 18, 15, 12, and 9 in.). The first five arcs shall be carried through a 45-deg angle to the next point of tangency. A 45-deg V-notch shall be cut into the edge of the mandrel for seating the pipe specimen. Holes shall be drilled at appropriate locations in the mandrel face for positioning the lever arm and fastening pipe clamps.

5.1.2 *Lever Arm-Roller Assembly*—A 1.83-m (72-in.) lever arm with nylon roller supplies the mechanical advantage necessary to bend the pipe specimen. The lever arm shall contain a series of holes which are used to maintain proper clearance between the roller and pipe sample during the bending operation.

5.2 *Thickness Gage*—Measurements of coating thickness will be required for this test. This shall be done in accordance with Method G 12.

5.3 *Holiday Detector*—A low-voltage d-c holiday detector of the wet-sponge type, specified in Method G 6, shall be used to locate breaks in the coating film.

6. Test Specimens

6.1 The test specimen should be 2.5 m (100 in.) in length. It should be representative of production-coated pipe and be free of obvious coating flaws or defects. Coating specimens shall be applied to 33.4-mm (1-in. nominal) diameter pipe.

7. Conditioning

7.1 The specimen shall be exposed to room temperature for a sufficient time to ensure thermal equilibrium in the pipe and coating. A temperature in the range from 20 to 30°C (68 to 85°F) shall be considered room temperature.

8. Procedure

8.1 Perform the test at a room temperature of 21 to 25°C (70 to 77°F).

8.2 Measure the applied coating thickness of each specimen in accordance with Test Method G 12.

8.3 Place the conditioned test specimen into the V-notch. Secure the pipe in place with clamp No. 1 and tighten the thumb screw. Remove the threaded handle from clamp No. 1 to allow for clearance of the lever arm. With the steel pivot pin at hole A of the lever arm (see Fig. 3), insert the pin into the socket on the bed of the bending jig. Place the nylon roller at position C on the lever arm. Apply the roller to the pipe specimen, and with a constant, even force with the lever handle, bend the pipe around the mandrel until the 460-mm (18-in.) radius bend has been made. Insert and secure pipe clamp No. 2. Continue bending the pipe until the 300-mm (12-in.) radius has been reached. Insert and secure pipe

¹ This method is under the jurisdiction of ASTM Committee G-3 on Durability of Nonmetallic Materials and is the direct responsibility of Subcommittee G03.06 on Durability of Pipeline Coatings and Linings.

FIG. 1 Variable-Radius Mandrel

clamp No. 3. Reposition the lever arm by moving the pivot pin to the 25-mm (1-in.) diameter hole in the mandrel surface. Move the nylon roller to position B on the lever arm. Apply the roller to the pipe and complete the bending operation by forming the specimen through the 230-mm (9-in.) radius.

8.4 Examine the bent specimen with a wet-sponge holiday detector to determine at what point, if any, cracking of the coating film occurred. Note the number, size, location, and type of cracks present. Examine the pipe specimen for any loss of coating bond caused by the bending operation.

NOTE 1—The possibility of some coatings developing stress-induced cracks in the period following the bending operation should not be overlooked. If this is a consideration, the bent specimen should be retained for a 24-h post-bent inspection.

9. Report

9.1 The initial test report shall include the following:

- 9.1.1 Complete identification of the coated pipe tested, including: name and type of coating, average coating thickness, minimum coating thickness, maximum coating thickness, manufacturer's lot number, and date of manufacture.
- 9.1.2 Temperature of the pipe specimen as tested,
- 9.1.3 Radius at which cracking first-occurred,
- 9.1.4 Description of the type of cracking,
- 9.1.5 Location and extent of any loss in pipe-to-coating bond,
- 9.1.6 Number of specimens tested,
- 9.1.7 Any peculiar characteristics of the specimen noted during the test or after immediate removal from the test apparatus, and
- 9.1.8 Post-bend retention time.

Standard Test Method for Effects of Outdoor Weathering on Pipeline Coatings¹

This standard is issued under the fixed designation G 11; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This test method is intended to define conditions for the exposure of coated pipe to weather.

1.2 This test method specifies qualifications for the samples, procedure to be followed in exposure to weather and procedure for evaluating effects of exposure including visual examination and other tests.

1.3 *This test method may involve hazardous operations and equipment. This test method does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of this test method to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

1.4 The values stated in SI units to three significant decimals are to be regarded as the standard.

2. Referenced Documents

2.1 ASTM Standards:

- G 8 Test Methods for Cathodic Disbonding of Pipeline Coatings²
- G 10 Test Method for Specific Bendability of Pipeline Coatings²
- G 12 Test Method for Nondestructive Measurement of Film Thickness of Pipeline Coatings on Steel²
- G 13 Test Method for Impact Resistance of Pipeline Coatings (Limestone Drop Test)²
- G 62 Test Methods for Holiday Detection in Pipeline Coatings³
- G 70 Test Method for Ring Bendability of Pipeline Coatings (Squeeze Test)³

3. Significance and Use

3.1 Since coated pipe may be stored outdoors for long periods before burial, weathering tests of the type described in this test method are needed to evaluate the stability of these coatings stored outdoors. The results obtained should be treated only as indicating the general effect of weathering. Exposure conditions vary greatly from year to year, from one part of a year to another, and from locality to locality. The results of short-term exposure tests in the north are more meaningful if exposure is started in the summer followed by a winter season. In southern areas where climatic conditions are more uniform throughout the year, the time of year when short-term exposure is started is less critical. In all localities,

the longer the exposure period, the more reliable are the results obtained.

4. Summary of Test Method

4.1 The effects of outdoor weathering on pipeline coatings after 6, 12, and 24 months' exposure are determined visually and by electrical means by comparing exposed samples of coated pipe with unexposed samples of coated pipe before and after impact and bending tests. At the beginning of the test the starting samples are qualified by a cathodic disbonding test.

5. Location of Test Sites

5.1 Weathering racks shall be located in cleared areas representative of local outdoor weather conditions.

6. Apparatus

6.1 *Racks*—The horizontal racks shall be any suitable pipe storage racks of sufficient height to prevent any undesirable effects of vegetation growth during the period of exposure. Racks may be constructed from a variety of materials, but pipe specimens must rest on a nonconductive surface. An example of a suitable rack is illustrated in Fig. 1.

7. Sampling

7.1 Each starting sample shall consist of coated 26.7-mm (1-in. nominal) diameter steel pipe from a production lot having a minimum length of 4.4 m (14.4 ft). The sample shall be from a lot produced under conditions capable of being duplicated on a production scale.

NOTE 2—Pipe having a nominal diameter of 33.4-mm (1-in. nominal) can be used and is the largest diameter that can be evaluated in accordance with Test Method G 10. Larger diameter pipes can be evaluated in accordance with Test Method G 70.

7.2 Each starting sample shall have a piece 600-mm (24-in.) long cut from one end by sawing for use in qualification testing (Section 8) and designated the "qualification sample." The remainder of each starting sample shall be designated the "sample."

7.3 The total number of samples for each coating in test shall be four, divided as follows:

- 7.3.1 One to be removed after 6 months exposure,
- 7.3.2 One to be removed after 12 months exposure,
- 7.3.3 One to be removed after 24 months exposure, and
- 7.3.4 One to be used for determining original control values, which should be obtained as soon as possible on receipt of the pipe.

8. Procedure for Qualification Testing

8.1 Test each qualification sample in accordance with Test Methods G 8, Method B.

¹ This test method is under the jurisdiction of ASTM Committee G-3 on Durability of Nonmetallic Materials and is the direct responsibility of Subcommittee G03.06 on Durability of Pipeline Coatings and Linings.

Current edition approved May 27, 1988. Published July 1988. Originally published as G 11 - 69 T. Last previous edition G 11 - 83.

² Annual Book of ASTM Standards, Vols 06.01 and 14.02.

³ Annual Book of ASTM Standards, Vol 14.02.

All lumber is to be pretreated and painted.

FIG. 1 Construction Details of Outdoor Weathering Rack

Begin qualification testing at the same approximate sample testing.

If the results of the qualification testing are within the limits given in Test Methods G 8, consider the test to be reasonably equivalent and proceed with testing.

If the results of the qualification testing are not within the limits given in Test Methods G 8, consider the test to be unequivalent and discontinue exposure testing.

Procedure for Sample Testing

Identify the test samples with a letter, number, or symbol for ready identification after exposure. The marking should not interfere with either the exposure or the testing.

Note and record the appearance of the sample.

Measure and record coating thickness in accordance with Test Method G 12.

Check coating for holidays with the appropriate device as described in Test Methods G 62.

Make two 80-mm (3-in.) long scribes through the coating to bare metal. Begin one scribe at a point approximately 230-mm (9-in.) from one end of the pipe and continue it for 80-mm along the length of the pipe; begin the second scribe at a point approximately 230-mm from the other end of the pipe and continue it for 80-mm along the length of the pipe. One scribe should be on the top of the pipe and the other on the bottom.

Mount the samples on the rack as shown in Fig. 1 with the samples facing skyward and one facing toward the ground. Mount the three samples together so that like samples are mounted alongside one another.

After exposure, again note and record the appearance of the sample and check for holidays in the manner followed

prior to exposure. Next examine the sample visually for cracking, checking, blistering, corrosion, undercutting from the intentional scribe, and any other form of impairment of the coating.

9.8 Finally, cut a 300-mm (12-in.) specimen from one end of the sample, where the scribe is facing downward, and subject to an impact test in accordance with Test Method G 13. In the impact test, position the specimen so that the scribe faces downward.

9.9 Subject the remaining 2.5 m (8.2 ft) to a bend test in accordance with Test Method G 10. In the bend test, position the skyward face of the sample as the outside of the bend.

9.10 Follow the procedure in 9.7, 9.8, and 9.9 on samples removed after each of the three exposure periods and compare results with those obtained on the control sample in 7.3.

10. Report

10.1 The report shall include the following:

10.1.1 Results of qualification tests,

10.1.2 Sample number and description of coating system including: surface preparation, method of application, and coating thickness,

10.1.3 Appearance of sample and presence or absence of holidays prior to exposure,

10.1.4 Appearance of sample, presence, or absence of holidays after exposure, and duration of exposure,

10.1.5 Visual evidence of coating failure as noted by 9.7,

10.1.6 Results of impact and bend tests after exposure as compared with those for the control sample, and

10.1.7 Type of environment and exposure.

11. Precision

11.1 The precision requirements for qualification testing

in Section 8.3 of this test method and the precision requirements given in Test Method G 12 shall apply. Variations in samples and qualification samples shall be within respective precision limits for this test method to be valid.

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 1916 Race St., Philadelphia, PA 19103.

Scope

1.1 This test method is applicable to the measurement of the thickness of nonmagnetic coatings on ferrous and nonferrous metal surfaces. It does not apply to the measurement of the thickness of magnetic coatings on ferrous metal surfaces.

1.2 This test method requires the use of magnetic induction equipment and equipment for the measurement of the thickness of the coating.

1.3 This test method is applicable to the measurement of the thickness of coatings in decimal units.

Summary

2.1 This test method is a nondestructive method for the measurement of the thickness of nonmagnetic coatings on ferrous and nonferrous metal surfaces.

Significance and Use

3.1 Magnetic induction methods are used for the measurement of the thickness of nonmagnetic coatings on ferrous and nonferrous metal surfaces. Adequate function of the magnetic induction method is required for the measurement of the thickness of coatings in decimal units.

3.2 The magnetic induction method is used for the measurement of the thickness of coatings in decimal units.

Apparatus

4.1 The magnetic induction gage is used for the measurement of the thickness of nonmagnetic coatings on ferrous and nonferrous metal surfaces. The magnetic induction gage is used for the measurement of the thickness of coatings in decimal units.

4.2 The magnetic induction gage is used for the measurement of the thickness of coatings in decimal units.

¹ This test method is a nondestructive method for the measurement of the thickness of nonmagnetic coatings on ferrous and nonferrous metal surfaces. It does not apply to the measurement of the thickness of magnetic coatings on ferrous metal surfaces.

Standard Test Method for Nondestructive Measurement of Film Thickness of Pipeline Coatings on Steel¹

This standard is issued under the fixed designation G 12; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This test method describes the nondestructive measurement of the thickness of a dry, nonmagnetic coating applied to the external surface of steel pipe. The method is recommended for coating thicknesses up to 6 mm (0.240 in.) and for any diameter pipe, but not smaller than 10 mm (0.5 in.). It does not apply to excessively soft films.

1.2 *This test method may involve hazardous operations and equipment. This test method does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of this test method to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

1.3 The values stated in SI units to three significant decimals are to be regarded as the standard.

2. Summary of Test Method

2.1 The coating thickness is determined by an instrument that measures thickness by nondestructive techniques, based on variations in magnetic flux or magnetic attraction between its detection unit and the magnetic base material.

3. Significance and Use

3.1 Measurements of film thickness are an essential part of most ASTM test methods related to coatings on steel pipe. Adequate thickness is important for a coating to fulfill its function of preventing or mitigating corrosion of steel pipelines.

3.2 The accuracy of the thickness measurements may be influenced by the deformability of the coating. This test method is not applicable to coatings that would be readily deformable under the force exerted by the probe of the measuring instrument.

4. Apparatus

4.1 The apparatus shall be a nondestructive-type thickness gage capable of being standardized over its range of intended use. It shall be designed so that variations in magnetic flux or magnetic attraction between its detection unit and the steel base can be calibrated to indicate the thickness of the coating material.

4.2 It shall be suitable for measuring thicknesses of dry, nonmagnetic coatings on either a flat or a circular base.

5. Standardization of Instruments

5.1 The instrument shall be standardized in accordance with the manufacturer's instructions before use by employing suitable thickness standards. The standardization shall be checked at frequent intervals during use.

5.2 Nonmagnetic standards of uniform thickness are available in either of two types, foil or coated substrate, as supplied or recommended by the manufacturer of the instrument.

5.2.1 *Foils (Shims)*—The thickness of the foil should be as close as possible to the expected thickness of the coating to be measured. The foil should be placed on a smooth, clean, low-carbon, steel plate, making certain that there is intimate contact between the foil and the substrate. It is recommended that single foils of proper thickness be used and that foils be replaced frequently, since they are subject to indentation. Foils are advantageous for standardizing on curved surfaces and are often more readily available than coated standards.

NOTE 1—For some instruments there is an effective depth of penetration of the field created by the instrument probe. This is the critical depth of thickness at which the instrument will no longer be affected by increases of substrate thickness. Since it depends on the instrument and substrate, it should be determined experimentally.

5.2.2 *Coated Substrate Standards*²—These standards consist of nonmagnetic coatings of known thickness permanently bonded to a low-carbon steel (1010 grade) substrate, 8 mm (0.30 in.) thick. The thickness standard should be as close as possible to the expected thickness of the coating to be measured.

NOTE 2—If the curvature of the coating to be measured is sufficient to preclude standardization on a flat surface, the standardization should be done with a standard foil on a substrate with the same curvature as the coating to be measured.

6. Procedure

6.1 Operate each instrument in accordance with the manufacturer's instructions.

6.2 Take a minimum of twelve readings per piece of pipe as follows: Take three equally spaced readings along the top surface; rotate the pipe 90° three times, taking three equally

¹ This test method is under the jurisdiction of ASTM Committee G-3 on Durability of Nonmetallic Materials and is the direct responsibility of Subcommittee G3.06 on Durability of Pipeline Coatings and Linings.

Current edition approved June 24, 1983. Published August 1983. Originally published as G 12 - 69 T. Last previous edition G 12 - 77.

² Coated substrate standards may be obtained from the U. S. Department of Commerce, National Bureau of Standards, Standard Materials Unit, Washington, DC 20234.

spaced readings after each rotation. Record the average, minimum, and maximum of the twelve readings as the coating thickness.

NOTE 3—Instruments with two contact poles shall be positioned on the coating surface with the poles in the same plane.

NOTE 4—The anchor pattern of the steel pipe substrate must be considered for its effect on the accuracy of the measurements if the anchor pattern is greater than 25 % of the coating thickness.

NOTE 5—Foreign materials such as dirt and grease shall be removed by suitable cleaning without removing any coating materials.

NOTE 6—Measuring instruments and methods may depend on the technique of the operator. For example, the pressure applied to a probe and the rate of applying a balancing force to a magnet will vary from one individual to another. Often such differences can be reduced or eliminated either by having the gage calibrated by the same operator who will make the measurement or by using constant-pressure probes. Probes must be positioned perpendicular to the surface of the specimen at the point of measurement. Some magnetic instruments of the magnetic-attraction type require the pole piece to be in a vertical position. If a magnetic instrument is to be used in a horizontal or upside-down position, its calibration for that position should be verified.

NOTE 7—Instruments using magnetic attraction are sensitive to the speed with which the magnet is removed from the specimen. The magnet must be removed so that thickness measurements are not affected by speed of removal.

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 1916 Race St., Philadelphia, PA 19103.

7. Report

7.1 The report shall include the following:

7.1.1 Complete identification of the specimen including name and code number of the coating; pipe diameter; source; production data, including surface preparation of the substrate and depth of anchor pattern, if known; and production run number.

7.1.2 Name and type of instrument used, and method of standardization, and

7.1.3 Number of thickness measurements taken, and the average, minimum, and maximum value of the measurements.

8. Precision

8.1 The repeatability and reproducibility of thickness measurements will depend on the instrument design, the operator, and the particular measuring application.

8.1.1 *Repeatability*—When the same instrument is used by the same operator, duplicate measurements on the same sample should agree with each other within $\pm 5\%$.

8.1.2 *Reproducibility*—Separate operators using different instruments on a known thickness standard should obtain average results agreeing with each other within 10 % of the thickness standard.

Standard Test Method for Impact Resistance of Pipeline Coatings (Limestone Drop Test)¹

This standard is issued under the fixed designation G 13; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

Scope

1.1 This test method covers the determination of the relative resistance of pipeline coatings to impact by observing the effects of falling stones on coated pipe specimens.

1.2 *This standard may involve hazardous operations and equipment. This standard does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

1.3 The values stated in SI units are to be regarded as the standard.

Referenced Documents

2.1 ASTM Standards:

G 12 Test Method for Nondestructive Measurement of Film Thickness of Pipeline Coatings on Steel²

G 62 Test Methods for Holiday Detection in Pipeline Coatings³

2.2 AASHTO Standard:

M80-51 (No. 67) Specification for Coarse Aggregate for Portland Cement Concrete

3. Summary of Test Method

3.1 The impact resistance of pipeline coatings is determined by dropping weighed amounts of a specified type of limestone through a chute onto a coated pipe specimen. Results are reported as the number of drops required to pierce through the coating to bare metal, as determined visually or electrically.

4. Significance and Use

4.1 This test is intended to simulate the effects of backfilling after pipe has been placed in the trench. The backfill is often rocky soil and, if it is unscreened and the coated pipe is unshielded by sand or other protective padding, the falling rocks may seriously damage the coating.

5. Apparatus

5.1 The impact apparatus shall be essentially as shown in Fig. 1 and shall include the following:

5.1.1 *Box with Chute*, providing a means of dropping

stones from a height of 1830 mm (6.0 ft) measured to the top of a piece of coated pipe under test. Construction details are shown in Fig. 2.

NOTE 1—The box and chute described in Fig. 2 are designed for testing coatings on 100-mm (4-in.) and 150-mm (6-in.) pipe specimens. Smaller diameter pipe may be used by inserting wood V-blocks in the trough in the box below the chute.

5.1.2 *Stones*, hard, coarse, limestone aggregate, conforming to AASHTO Designation: M80-51 (No. 67) which is taken from American Association of State Highway and Transportation Officials "Standard Specifications for Coarse Aggregate for Portland Cement Concrete."

NOTE 2—These specifications cover the quality and size of coarse aggregate. No. 67 designates a 19-mm (¾-in.) to No. 4 size stone with the following sieve analysis:

Square Opening, mm (in.)	Weight % Passing
25 (1)	100
19 (¾)	95 to 100
10 (⅝)	20 to 55
No. 4	0 to 10

5.1.3 *Bucket*—Any suitable bucket that will hold 16 kg (35 lb) of stones.

5.1.4 *Holiday Detectors*—Two types are needed as described in Test Method G 62.

NOTE 3—A holiday is defined as small faults or pinholes that permit current drainage through protective coatings on steel pipe.

5.1.5 *Thickness Gages*—Any instruments suitable for use with Test Method G 12.

6. Test Specimens

6.1 Test specimens shall be 600 mm (24 in.) long and shall be cut from a representative piece of coated pipe. Only holiday-free specimens shall be used in the test.

7. Procedure

7.1 Perform the test at a room temperature of 21 to 25°C (70 to 77°F).

7.2 The procedure consists of dropping up to 10 buckets of stones on coated specimens. The number of buckets of stones required represents the resistance of the coating to this type of impact.

7.3 Place the test specimen in the trough below the chute. Insert the retaining board in the top part of the chute and hold it in place across the chute opening with a suitable metal or wood clip. Weigh 16 ± 0.2 kg (35 ± 0.5 lb) of stones into the bucket. Lift the bucket to the top of the chute. Empty the stones into the trough formed by the hopper walls and the retaining board so that the stones are distributed evenly in the trough. Detach the holding clip from the

¹ This test method is under the jurisdiction of ASTM Committee G-3 on Durability of Nonmetallic Materials and is the direct responsibility of Subcommittee G03.06 on Durability of Pipeline Coatings and Linings.

Current edition approved April 28, 1989. Published June 1989. Originally published as G 13 - 69 T. Last previous edition G 13 - 85.

³ Annual Book of ASTM Standards, Vol 14.02.

FIG. 1 Box, Chute, and Bucket

retaining board and tilt the board forward to release the stones. Experience with this procedure has indicated that the stones are so constricted within the narrow confines of the chute that they fall in a uniform manner.

7.4 After each drop, remove the specimen. Examine the specimen visually for breaks in the coating. If there are no visual breaks, check with the holiday detector appropriate for the coating thickness for holidays in the coating. If there is no visual or electrical evidence of holidays, repeat the test until the first holiday is detected and record the number of drops and the number of holidays detected. In repeating the test, the specimen should be replaced in the trough so that the same portion of the coated surface is always subjected to the falling stones. After the same stones have been used five times, they should be replaced.

7.5 If no failure has occurred after 10 buckets, terminate the test.

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 1916 Race St., Philadelphia, PA 19103.

NOTE—Framing lumber 40 by 90 mm (2 by 4 in.); all other material 20 mm (3/4 in.).

FIG. 2 Construction Details of Box and Chute

NOTE 4—As indicated in 7.4, the same charge of stones may be used five times. Experiments in which the same charges of stones were dropped more than five times have shown relatively little attrition of the stones.

8. Report

8.1 The report shall include the following:

8.1.1 Complete identification of the specimen including: name and code number of the coating, pipe diameter, coating thickness, source, production data, and production-run number,

8.1.2 Approximate pipe temperature at the beginning and at the end of the test, and

8.1.3 Number of buckets of stone to produce the first holiday and the number of holidays produced during this drop.

NOTE 5—If there is a large number of holidays after a given number of drops, the report should state this by the term "too numerous to count."

Standard Test Method for Impact Resistance of Pipeline Coatings (Falling Weight Test)¹

This standard is issued under the fixed designation G 14; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This test method covers the determination of the energy required to rupture coatings applied to pipe under specified conditions of impact from a falling weight.

1.2 *This test method may involve hazardous operations and equipment. This test method does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of this test method to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

1.3 The values stated in SI units to three significant decimals are to be regarded as the standard.

2. Referenced Documents

2.1 ASTM Standards:

G 12 Test Method for Nondestructive Measurement of Film Thickness of Pipeline Coatings on Steel²

G 62 Test Methods for Holiday Detection in Pipeline Coatings³

2.2 SAE Standard:

Grade 52100 Steel⁴

3. Summary of Test Method

3.1 This test method uses a falling fixed weight having a specified diameter impact surface, *tup*, which is restrained vertically and dropped from varying heights to produce impact energies over the required range. Electrical inspection is used to detect resultant breaks in the coating. Impact resistance is determined as the amount of energy required to cause penetration of the coating film.

4. Significance and Use

4.1 The ability of a pipe coating to resist mechanical damage during shipping, handling, and installation will depend upon its impact resistance. This test method provides a systematic means for screening coating materials with regard to this property.

5. Apparatus

5.1 This test method can be successfully used with impact apparatus conforming to the following specifications:

5.1.1 *Tup*—The tup shall be made up from a tup body and a tup nose having a combined, fixed weight of 1.361 kg (3.00 lb) and shall be used over a drop range of 0.61 to 1.22 m (2 to 4 ft). With most coatings, a 1.361-kg (3.00-lb) tup dropped through a distance of 914 mm (3 ft) yields suitable results. The tup nose shall have a 15.875-mm ($\frac{5}{8}$ -in.) hemispherical head.

NOTE 1—Frequent replacement of the tup nose can be avoided if it is cut from steel capable of being hardened to a hardness of Rockwell C/45 while retaining an impact toughness of at least 15 ft-lb (20.34 J). Ball bearings conforming to SAE Grade 52100 have also been found suitable for this purpose.

5.1.2 *Drop Tube*—A tube 1.52 m (5 ft) long shall be used to contain the tup and guide it during free fall. The drop tube shall be constructed of steel, aluminum, or any other suitably rigid material and internally sized to provide a minimum of friction to the falling tup. A scale shall be attached for measuring the height of drop to the nearest 2.54 mm (0.10 in.).

5.1.3 *Specimen Holder*—The base plate of the apparatus shall include a device for positioning and holding the pipe specimen on line with the axis of the vertical drop tube.

NOTE 2—An arrangement using a V-notch vise made of metal with spring clamp is recommended for this purpose. Glancing blows, caused by an out-of-plumb condition between drop tube and pipe sample, will cause erratic test results.

5.1.4 *Apparatus Support*—Both the apparatus and sample shall be firmly supported and secured to a rigid base to optimize energy transfer from the tup to the specimen.

5.2 A design for the test apparatus appears in Figs. X1.1 through X1.3 of Appendix X1.

5.3 *Thickness Gage*—Measurements of coating thickness will be required for this test, and shall be done in accordance with Method G 12.

5.4 *Holiday Detector*—A suitable detector as specified in Test Methods G 62 shall be used to locate breaks in the coating film.

6. Test Specimen

6.1 The test specimen shall be a 406.4 mm (16 in.) long piece of Schedule 40, 60.325 mm (2.375 in.) outside diameter coated pipe prepared with its surface preparation and coating procedures equivalent to that of production coated pipe.

6.2 Seven specimens shall be required for the test.

7. Conditioning

7.1 The specimen shall be exposed to a room temperature of 21 to 25°C (70 to 77°F) for a period of 24 h before beginning the test.

¹ This test method is under the jurisdiction of ASTM Committee G-3 on Durability of Nonmetallic Materials and is the direct responsibility of Subcommittee G03.06 on Durability of Pipeline Coatings and Linings.

Current edition approved May 27, 1988. Published July 1988. Originally published as G 14 - 69 T. Last previous edition G 14 - 83.

⁴ Available from Society of Automotive Engineers, 400 Commonwealth Drive, Warrendale, PA 15096.

8. Preliminary Measurements

8.1 Measure the applied coating thickness of each specimen in accordance with Test Method G 12.

8.2 Place test specimen in sample holder and lightly place tup on surface of the coating. Adjust either the drop tube or the attached scale so that the wing bolt (lifting pin) is at the zero mark of the scale.

8.3 Make a preliminary set of impact readings to determine the approximate starting point for the test. This shall be done by striking the first specimen from a height sufficient to cause failure of the coating film. Consider any penetration a failure if it is detectable with a suitable Holiday Detector as specified in Test Methods G 62.

8.3.1 Reduce the height by 50 % and make a second exploratory drop at a fresh area on the pipe surface. Continue testing in this manner, with the corresponding reduction in height between drops, until the coating fails to break.

NOTE 3—Choose test locations at the specimen surface in a random manner and keep at least a 76.2-mm (3-in.) distance between adjacent points of impact and within 38 mm (1½ in.) from the ends. Choosing test points in any regular pattern will bias the experiment and introduce error into the test results.

8.3.2 Repeat the test at the height immediately preceding the occurrence of the nonfailure to determine if an approximate level for the mean impact strength has been bracketed. Two successive reversals of coating performance between failure and nonfailure will give sufficient indication that the point has been reached.

9. Procedure

9.1 Perform the test at a room temperature of 21 to 25°C (70 to 77°F).

9.2 Begin testing from the approximate height determined in 8.2 and corresponding to the point at which the first nonfailure was registered. Maintain a fixed increment between adjacent testing heights.

9.3 Use a suitable detector, as specified in Test Method G 6, to determine penetration or lack thereof of the coating after each individual impact.

9.4 If the coating film is penetrated on the initial drop, make the next test at the next lower height increment. If the first specimen does not fail, make the second test at the next higher increment.

9.5 In a similar manner, determine the height of fall by the performance of the coating on each preceding drop. Maintain a constant height increment between readings. Continue to apply this "up-and-down" method⁴ until 20 successive impact readings have been made.

⁴ This system of testing, nomenclature, and calculation is described by Dixon, W. J. and Mood, A. M., "A Method for Obtaining and Analyzing Sensitivity Data," *Journal Am. Statistical Assn.*, JSTNA, Vol 43, March, 1948, p. 109.

10. Calculation

10.1 Calculate the mean value of impact strength, m , in g/cm (or in./lb) as follows:

$$m = \left[h_0 + d \left(\frac{A}{N} \pm \frac{1}{2} \right) \right] \times W$$

where:

h_0 = minimum height at which the less frequent event occurs, cm (or in.),

d = increment in height of drop, cm (or in.),

A = sum of the frequency of occurrence at each height increment times the number of increments above the h_0 value for each observation in the N total,

N = total number of the less frequent event (coating failures or nonfailures), and

W = tup weight, g (or lb).

NOTE 4—The minus sign is used when the calculation of the mean is based on the total number of coating failures and the plus sign when it is based on the nonfailures.

10.2 Calculate the sample standard deviation, s , in gram-centimetres (or inch-pounds) as follows:

$$S = 1.620 dW \left(\frac{(NB - A^2)}{N^2} + C \right)$$

where:

C = 0.737 when d is in cm, or 0.029 when d is in in.,

d , N , A , and W are as defined in 10.1, and

B = sum of the frequency of occurrence at each height increment times the square of the number of increments above the h_0 value for each observation in the N total.

NOTE 5—Adequate definition of coating impact strength will result only if the height increment, d , has been properly chosen. When testing polymeric films in the range from 0.254 to 1.016 mm (0.010 to 0.040 in.), height increments of from 5.1 to 12.7 mm (0.2 to 0.5 in.) have been found suitable with the 1.361-kg (3.0-lb) tup. Larger increments may be necessary for thicker materials. If after making the calculations of 10.1 and 10.2, the ratio of the height increment to the standard deviation (d/s) is less than 0.20, the test should be repeated using a larger value for the increment d . This procedure will result in an improved estimate of the coating impact strength.

10.3 An illustration of the use of these equations appears in Appendix X2.

11. Report

11.1 The report shall include the following:

11.1.1 Complete identification of the specimen including:

11.1.1.1 Name and code number of the coating,

11.1.1.2 Size of pipe,

11.1.1.3 Source, production date, and production-run number,

11.1.1.4 Minimum, maximum, and average coating thickness,

11.1.1.5 Date of test, and

11.1.1.6 Other information that may be pertinent,

11.1.2 Average impact strength in g/cm (or in./lb),

11.1.3 Sample standard deviation in g/cm (or in./lb).

APPENDIXES

FIG. X1.2 Detailed Design of Test Apparatus

FIG. X1.3 Detailed Design of Test Apparatus

X2. SAMPLE CALCULATIONS

X2.1 Test results for 20 drops with a 1.361-kg (3-lb) tup are given in Table X2.1.

TABLE X2.1 Test Results

Test No.	Height of Drop, in.	Failed	Test No.	Height of Drop, in.	Failed
1	14.1	yes	11	13.5	no
2	13.8	no	12	13.8	no
3	14.1	no	13	14.1	yes
4	14.4	yes	14	13.8	yes
5	14.1	yes	15	13.5	no
6	13.8	no	16	13.8	yes
7	14.1	no	17	13.5	yes
8	14.4	yes	18	13.2	no
9	14.1	yes	19	13.5	no
10	13.8	yes	20	13.8	yes

Height increment = 0.3 in.

Failures = 11

Nonfailures = 9

Nonfailures at 13.2 in. (h_0) = 1; at 13.5 in. = 3; at 13.8 in. = 3; at 14.1 in. = 2 $A = (0 \times 1) + (1 \times 3) + (2 \times 3) + (3 \times 2) = 15$ $B = ((0)^2 \times 1) + ((1)^2 \times 3) + ((2)^2 \times 3) + ((3)^2 \times 2) = 33$

$$m = \left[13.2 + 0.3 \left(\frac{15}{9} + \frac{1}{2} \right) \right] 3.0 = 41.55 \text{ in.} \cdot \text{lb}$$

mean impact resistance = 41.55 in.·lb

$$S = 1.620 \times 0.29 \times 3.0 \left(\frac{9 \times 33 - (15)^2}{(9)^2} \right) = 1.338 \text{ in.} \cdot \text{lbs.}$$

Sample standard deviation = 1.338 in.·lb

Standard Test Method for Penetration Resistance of Pipeline Coatings (Blunt Rod)¹

This standard is issued under the fixed designation G 17; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This accelerated test method is used to determine the relative resistance of steel pipeline coatings to penetration or deformation by a blunt rod under a specified load. The test method is intended to apply to the testing of all types of nonmetallic pipeline coatings subjected to various temperatures.

1.2 *This test method may involve hazardous operations and equipment. This test method does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of this test method to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

1.3 The values stated in SI units to three significant decimals are to be regarded as the standard.

2. Summary of Test Method

2.1 The depth or rate of penetration or deformation that is caused by a weighted blunt rod to a coating system applied to steel pipe is measured over a period of time with a micrometer depth gage. Three consecutive identical readings taken at specified intervals conclude the test.

3. Significance and Use

3.1 Since pipeline coatings are subjected to concentrated pressures exerted by the weight of the pipe and the backfill, this test is intended primarily for determining the resistance of the coating to penetration or deformation under controlled conditions.

3.1.1 Deformation of a compressible coating does not signify a potential weakness in underground burial service, if the coating is not penetrated. Deformation cannot be compared to penetration into and through a coating.

4. Apparatus

4.1 Test apparatus shall consist of a dead weight tester that can press the flat tip of a rod against the coated pipe. The flat-tipped end of the rod contacting the coating shall have a diameter of $6.350 \text{ mm} \pm 0.0254 \text{ mm}$ ($0.250 \text{ in.} \pm 0.001 \text{ in.}$) and together with supplementary weight and any other weight-contributing parts shall have a total weight of 4.453 kg (9.817 lb), resulting in a unit pressure of 14.060

FIG. 1 Blunt Rod Penetration Tester

kg/cm² (200 psi) against the coating. Detailed design of the apparatus is shown in Fig. 1 through 6.

4.2 *Depth Gage*, a device capable of measuring the penetration movement of the rod accurately to 0.0254 mm (0.001 in.).

4.3 *Temperature Chamber*, a thermostatically controlled enclosure to provide heating and cooling of the specimen and test apparatus (excluding depth gage) to within $\pm 2^\circ\text{C}$ (3.6°F) of the desired test temperature. This equipment is optional when the test can be run within $\pm 2^\circ\text{C}$ (3.6°F) of the desired test temperature without its use.

4.4 *Temperature Controlled Box*, to fully enclose the test apparatus except the indicating means of the depth gage, as optional equipment in cases where a test is to be run at a temperature higher than room temperature. The enclosure shall be thermostatically controlled, capable of maintaining the temperature to within $\pm 2^\circ\text{C}$ (3.6°F) of the test temperature, which normally will be in the range of 23 to 76.6°C (73.4 to 170°F).

4.5 *Thermometer*, a temperature measurement device accurate to $\pm 0.5^\circ\text{C}$ ($\pm 1^\circ\text{F}$).

5. Test Specimens

5.1 The test specimens shall be 150 mm (6 in.) long and prepared with its surface preparation and coating procedures

¹ This test method is under the jurisdiction of ASTM Committee G-3 on Durability of Nonmetallic Materials and is the direct responsibility of Subcommittee G03.06 on the Durability of Pipeline Coatings and Linings.

FIG. 6

adjacent in the as-produced condition or were taken from different lengths of pipe may represent differing process conditions.

10.2 Repeatability—Initial and final measurements

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 1916 Race St., Philadelphia, PA 19103.

should be ± 0.0127 mm (0.0005 in.) or 5 %.

10.3 Reproducibility—The results reported by one laboratory should not differ from those of another laboratory by more than ± 5 % of the net penetration.

Standard Test Method for Joints, Fittings, and Patches in Coated Pipelines¹

This standard is issued under the fixed designation G 18; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This test method describes determination of the comparative corrosion preventative characteristics of materials used for applications to joints, couplings, irregular fittings, and patched areas in coated pipelines. The test method is applicable to materials whose principal function is to act as barriers between the pipe surface and surrounding soil environment.

1.2 The test method described employs measurements of leakage current, capacitance, and dissipation factor to indicate changes in the insulating effectiveness of joint and patching materials.

1.3 *This standard may involve hazardous operations and equipment. This standard does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

1.4 The values stated in SI units to three significant decimals are to be regarded as the standard.

2. Referenced Documents

2.1 ASTM Standards:

G 12 Test Method for Nondestructive Measurement of Film Thickness of Pipeline Coatings on Steel²

3. Summary of Test Method

3.1 The test method consists of an immersion test where coated pipe specimens, each containing a simulated joint, tee, or patched area, are suspended in an electrolyte and placed under cathodic protection by connecting the specimens to the negative (-) terminal of a 6-V d-c power supply (see Fig. 1). An anode, also immersed in the electrolyte and connected to the positive (+) terminal of the power supply, completes the test circuit. Joint or patch performance is followed through periodic determinations of leakage current measured as voltage drops across a calibrated resistor in the anode-to-cathode circuit.

3.2 Capacitance and dissipation factor measurements are used to supplement the periodic leakage current determinations.

4. Significance and Use

4.1 The exposed metal surfaces at joints, fittings, and

damaged areas in an otherwise coated pipeline will be subjected to corrosion if allowed to come in contact with the soil environment. The performance of joint and patching materials designed to function as protective coverings will depend upon such factors as the ability of the material to bond to both the pipe coating and exposed metal surfaces, the integrity of the moisture seal at lapped joints, and the water absorption characteristics of the joint material.

4.2 The existence of substantial leakage current through the coating joint, patch, or fitting is reliable evidence that the material has suffered a significant decrease in its performance as a protective barrier. In a similar manner, measured changes in joint capacitance and dissipation factor are useful because they are related to the water absorption rate of the joint material. Water permeating an insulating barrier increases its capacitance and its progress can be measured through the use of a suitable impedance bridge.

5. Apparatus

5.1 *Test Vessel*, nonconducting, shall be used to contain the test specimens. Dimensions of the vessel shall permit the following requirements:

5.1.1 The test vessel shall be large enough to allow for suspension of the specimens in a vertical position and equidistant from a centrally located anode. The specimens shall not touch either each other, the walls, or bottom of the test vessel.

5.1.2 The test vessel shall be deep enough to allow for immersion of the specimens in the electrolyte to the lower edge of the upper moisture shield (see Fig. 2).

NOTE 1—A commercially available, 42 L (11-gal) waste container of high-density polyethylene can be conveniently used as a test vessel and will accommodate up to six test specimens of a size indicated in 7.2.

5.2 *Support Plate*, fabricated from a nonconductive material, to suspend the specimens in the test vessel. The support plate shall contain an access hole for the reference electrode. A typical test cell is illustrated in Fig. 3.

5.3 *Anode*, fabricated from 9.525 mm (0.375-in.) diameter 300 series stainless steel rod, 609.6 mm (24.00 in.) long. Other inert anodes such as carbon or platinum may be used.

5.4 *D-C Voltmeter*, to serve the dual purpose of (1) measuring leakage current as a potential drop across a 1,000- Ω shunt in the measuring circuit and (2) measuring the potential of the test specimen with reference to a Cu-CuSO₄ half cell. The instrument characteristics for these functions shall be:

5.4.1 *Voltage Range*—50 μ V full scale to 10 V full scale in overlapping 1 $\times$ and 3 $\times$ ranges.

5.4.2 *Accuracy*— ± 3 percent of full scale on all ranges.

5.4.3 *Input Resistance*—Greater than 10 M Ω on all ranges.

¹ This test method is under the jurisdiction of ASTM Committee G-3 on Durability of Nonmetallic Materials and is the direct responsibility of Subcommittee G03.06 on Durability of Pipeline Coatings and Linings.

Current edition approved Sept. 30, 1988. Published November 1988. Originally published as G 18 - 71 T. Last previous edition G 18 - 83.

² *Annual Book of ASTM Standards*, Vols 06.01 and 14.02.

FIG. 1 Test Circuits

5.5 *Thickness Gage*—Measurements of coating thickness will be required for this test. Any instrument suitable for use with Test Method G 12² can be used. However, the choice of measuring gage shall be compatible with the joint coating thickness that will be encountered in the test.

5.6 *Ohmmeter*—Measurements for end-cap integrity shall be made with a suitable ohmmeter capable of reading resistance to an upper limit of $1000 \text{ M}\Omega \pm 5\%$.

5.7 *Reference Electrode*—A Cu-CuSO₄ half cell of conventional glass or plastic tube with porous plug construction, but preferably not over 19.05 mm (¾ in.) in diameter, having a potential of -0.316 V with respect to the standard hydrogen electrode.

NOTE 2—A saturated calomel half cell may be used, but measurements made with it shall be converted to the Cu-CuSO₄ reference for reporting by adding -0.072 V to the observed reading.

5.8 *Voltage Source*—A battery or rectifier-type power supply shall be used to maintain a potential difference of $6.0 \pm 0.1 \text{ V}$ dc between each of the test specimens and the Cu-CuSO₄ half cell. Where multiple specimens are tested, a suitable voltage-dividing circuit will be required for individual control of the voltage applied to each specimen.

5.9 *Circuit Wiring* from the anode to specimen shall be of No. 18 Awg insulated copper. A switch for disconnecting each specimen from its voltage source shall be included in the circuit. A $1000 \Omega \pm 1\%$ percent, 1-W (minimum) precision resistor shall be placed in the anode-to-cathode circuit as a shunt for current. A diagram illustrating the test cell wiring appears as Fig. 1.

5.10 *Capacitance Bridge*—Measurements of specimen capacitance and dissipation factor shall be made with a low-voltage a-c, resistive ratio arm-type bridge³ having the following characteristics:

5.10.1 *Oscillator Frequency*, 1 kHz $\pm 2\%$ tolerance.

5.10.2 *Series Capacitance Range*, 100 pF to 1100 pF accuracy $\pm 1\% \pm 1 \text{ pF}$, whichever is larger.

5.10.3 *Dissipation Factor Range*, 0.002 to 1.0 at 1 kHz accuracy $\pm 5\%$ or ± 0.001 dissipation, whichever is larger.

5.11 *Connectors*—Miniature, pin-type, insulated jacks shall be used at the point of connection to each test specimen. The jacks serve two important functions: (1) they permit the disconnection of the specimen from the voltage source when the impedance bridge is in use, and (2) disconnection of the specimen from the test circuit also removes the effect of stray capacitance due to excessive lead length that may introduce error into impedance bridge measurements.

5.12 *Foil Shield*—As an additional safeguard against stray capacitance effects, wrap the entire test vessel in heavy-gauge aluminum foil as shown in Fig. 3 and ground the shield.

6. Materials

6.1 *Electrolyte*—The electrolyte shall consist of potable tap water with the addition of 3 weight percent of technical-grade sodium chloride.

6.2 Materials for sealing the ends of the specimens may consist of waxes, epoxies, or other suitable materials. However, they should have a dielectric constant in the range from 2 to 6, and exhibit a low water-absorption rate. It is also important that the end-cap material maintains good adhesion to any coated pipe surfaces throughout the test period.

7. Test Specimen

7.1 The joint specimen shall be prepared from a representative piece of 60.325 mm (2.375 in.) outside diameter, Schedule 40, production-coated pipe.

7.2 Each piece of coated pipe shall be 381 mm (15.0 in.) long and serve as a carrier for the particular joint material to be tested.

7.3 The simulated coating joint shall be made by cleaning away a 101.6 mm (4.0-in.) band of pipe coating starting from a point 203.2 mm (8.0 in.) below the upper end of the pipe. The coating may be removed by power brushing or any other suitable device that will remove all of the coating in the area indicated and leave a clean metal surface behind.

7.4 The lower end of the test specimen shall be plugged flush with a stopper and sealed or capped with a material meeting the requirements of 6.2.

7.5 When used, the primer shall be applied to the test specimen in sufficient quantity to coat the test specimen from a point 88.9 mm (3.50 in.) below its upper end and ending at a point 317.5 mm (12.5 in.) from the upper end. This will allow for a 12.7-mm (0.5-in.) band of excess primer beyond each tape margin.

7.6 The joint material to be tested shall be applied to the prepared pipe specimen (using a spiral wrap for tapes) and starting from a point 101.6 mm (4.0 in.) below the upper end of the pipe section and ending at a point 304.8 mm (12.0 in.) from the upper end. The 203.2 mm (8.0 in.) of joint material thus applied should overlap the bared section of pipe by 50.8 mm (2.0 in.) at each end. This distance represents the typical cut-back distance encountered in the field joining, through welding, of coated pipe in 60.325 mm (2.375 in.) outside diameter size. A diagram of the joint specimen appears as Fig. 2.

³ Instruments found to meet these requirements are the General Radio Type 1650-B Impedance Bridge and the Heath Co. Model 1B-28 Impedance Bridge (Kit).

7.7 The manner of applying the joint material shall be done in accordance with the manufacturer's specifications. The supplier of the joint material should specify the desired time interval between the application of the material and the start of the test.

NOTE 3—Materials that are intended for use as a field-applied patch over damaged areas on coated pipelines can be tested using the same procedures, with the patching compound applied, instead, to the bared area of the simulated joint.

7.8 The upper 76.2 mm (3.0 in.) of the completed joint test specimen shall be coated with the material used for the lower end cap. This moisture shield can be conveniently made, in the case of some waxes and epoxies, with several successive brush or dip-applied applications. The thickness of the moisture shield should be approximately 3.175 mm (0.125 in.).

8. Testing Temperature

8.1 Perform all tests at a room temperature of 21 to 25°C (70 to 77°F).

9. Preliminary Test Measurements

9.1 *Coating and Joint Thickness*—Measure and record the thickness of the base coating which lies exposed at each end of the test joint. Measurements shall be made in accordance with Method G 12. In a like manner, measure and record the average thickness of the joint covering.

10. Procedure for Leakage Current Measurements

10.1 Suspend the joint test specimens in the test vessel, observing the clearances specified in 5.1.1 and 5.1.2. Fill the vessel with electrolyte, bringing the fluid level up to a point midway between the end cap and the lower edge of the joint material.

10.2 Connect one terminal of the ohmmeter to the test specimen and the other terminal to the central anode. The

NOTE—All dimensions are in millimetres with inches in parentheses.

FIG. 2 Joint Test Specimen

FIG. 3 Joint Test Cell

anode should be in contact with the electrolyte. Measure the apparent sample-to-anode resistance in ohms. The reading shall remain above 1000 MΩ for 15 min. Readings below this value probably indicates a faulty end-cap seal which should be repaired before the joint specimen is totally immersed.

10.3 Totally immerse the joint test specimens up to the lower edge of the moisture shield. This level shall be maintained throughout the test period by regular additions of tap water. The test shall be performed at room temperature.

10.4 Connect each joint test specimen in series with a 1000-Ω ± 1% (1-W) resistor, a suitable switch, and the negative (-) terminal of the voltage source.

10.5 Connect the central stainless steel anode to the positive (+) terminal of the voltage source.

10.6 Energize the voltage source. Adjust the voltage to each specimen by connecting a voltmeter between each sample and the Cu-CuSO₄ half cell and varying the voltage output until 6.0 V are measured between sample and half cell (see Fig. 1).

10.7 As soon as the circuit is energized and voltage adjusted to each joint test specimen, measure and record the voltage across each 1000-Ω shunt resistor.

10.8 Measure and record the closed circuit potential, E_B , and open circuit potential, E_o , of each joint specimen with reference to the saturated Cu-CuSO₄ half cell.

NOTE 4—Any drop in closed circuit potential (E_B) of a joint specimen greater than 20% of the terminal voltage (E_t) probably indicates a developing current leak in the joint area. In a like manner, any open circuit potential (E_o) greater than 0.05 V may indicate the presence of a developing conductive path across the test joint. (Both voltages are referenced to the Cu-CuSO₄ half cell.)

10.9 Using the d-c voltmeter in 5.4 measure and record the voltage appearing across the terminals of the voltage supply.

10.10 Continue, on a periodic basis, the measurements specified in 10.7 through 10.9. Calculate the apparent joint

resistance by the method described in 12.1.

10.11 Prior to removal, reexamine a suspected joint failure to confirm that any observed drop in joint resistance is not due to a faulty end-cap seal. This can best be accomplished by removing the specimen from the test cell and allowing it to dry. When dry, reimmerse it to just above the level of the lower end cap and check the integrity of the cap by the method outlined in Section 8.

11. Procedure for Measurement of Capacitance and Dissipation Factor

11.1 The series capacitance and dissipation factor between each joint sample and the central stainless-steel anode shall also be measured. These measurements shall be made at the time of initial immersion and continued on an identical schedule with the voltage readings. They shall be made in the following manner:

11.2 Temporarily disconnect the test specimen from the voltage source. Connect the impedance bridge between the test specimen and stainless-steel anode. Energize the bridge and measure the equivalent series capacitance, C , and dissipation factor, DF , or the test specimen using a "null" technique to balance the measuring bridge.

11.3 A continued rise in joint capacitance and dissipation factor from the values recorded at the time of initial immersion, will indicate progressive absorption of water by the joint material.

11.4 The joint test shall continue for 180 days or until the joint resistance falls to a value of 4600Ω for 1 m^2 ($50\,000 \Omega$ for 1 ft^2) of immersed joint surface.

12. Calculations

12.1 *Joint Resistance*—Calculate the resistance, R_j , for the joint sample as follows:

$$R_j = 1000 A[(E_B - E_o)/E_s]$$

where

R_j = resistance, Ω/cm^2 (Ω/ft^2),

A = immersed sample area (excluding end cap), cm^2 (ft^2),

E_B = closed circuit potential of sample (reference Cu-CuSO_4), V (switch closed),

E_o = open circuit potential of sample (reference Cu-CuSO_4), V (switch open), and

E_s = voltage across $1000\text{-}\Omega$ shunt resistor, V, (switch closed).

13. Report

13.1 All test reports shall include the following:

13.1.1 Complete identification of the joint specimen including:

13.1.1.1 Name and code number of the base coating,

13.1.1.2 Thickness of the base coating,

13.1.1.3 Name and code number of the joint material, including type (that is tape, two-part mix, etc.),

13.1.1.4 Method of application of joint material, including amount of overlap.

13.1.1.5 Where applicable, the width and thickness of the joint material (tapes),

13.1.1.6 Where applicable, the name, code number, and type of primer,

13.1.1.7 Where applicable, the method of application of primer,

13.1.1.8 Average thickness of the joint material, as applied, and

13.1.1.9 Dates of starting and terminating the test and other information that may be pertinent.

13.2 The following readings shall be recorded on a periodic basis:

13.2.1 Voltage across the $1000\text{-}\Omega$ shunt resistor, E_s ,

13.2.2 Closed-circuit potential of the joint specimen referenced to the Cu-CuSO_4 half cell, E_B ,

13.2.3 Open-circuit potential of the joint specimen referenced to the Cu-CuSO_4 half cell, E_o ,

13.2.4 Terminal voltage at the power supply, and

13.2.5 Calculated value of joint resistance, R_j ,

13.2.6 Initial series capacitance of the joint sample, and

13.2.7 Initial dissipation factor of the joint sample.

NOTE 5—The frequency of experimental readings will depend upon the performance of each joint specimen. Specimens that show a high rate of change may require more frequent watching if the point of failure is to be recorded. Normally, weekly readings have been found to be adequate. Joint performance can be conveniently followed through plots of Joint Resistance versus Time and Dissipation Factor versus Time in semilogarithmic coordinates, and Capacitance Change versus Time in rectangular coordinates.

14. Precision

14.1 Due to the range of joint coating formulations, thicknesses, densities, etc. found among commercially available materials, the over-all accuracy and reproducibility of test results by these methods will tend to be poorer than those expected on straight runs of coated pipe. The fact that most joint materials are hand-applied introduces an inherent factor of variability into the test results. The basic purpose of these methods is to provide a means for the comparative screening of combinations of joint materials and base coatings for insulating effectiveness.

14.2 The precision (reproducibility) of the joint resistance determination by these methods is considered to be such that when two tests are performed consecutively on the same specimen and under identical conditions of application, the difference between the two results may normally be expected not to exceed $\pm 10\%$ of their mean.

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 1916 Race St., Philadelphia, PA 19103.

Standard Test Method for Disbonding Characteristics of Pipeline Coatings by Direct Soil Burial¹

This standard is issued under the fixed designation G 19; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

Scope

1.1 This test method describes the determination of the relative disbonding characteristics of damaged coatings on steel pipe by cathodic protection potentials in direct soil burial. This test method is intended to apply to the testing of all types of nonmetallic pipeline coatings and tapes including thermoplastics, thermoset, and bituminous materials.

1.2 Results may vary widely when test sites are in different geographical areas of the country, and even in different localities.

1.3 This test method is limited to nonconducting, or nonmetallic pipe coatings and is not applicable to conducting materials such as zinc coatings on steel pipe.

1.4 This test method may involve hazardous operations and equipment. This test method does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of this test method to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

1.5 The values stated in SI units to three significant decimals are to be regarded as the standard.

2. Referenced Documents

2.1 ASTM Standards:

G 12 Test Method for Nondestructive Measurement of Film Thickness of Pipeline Coatings on Steel²

G 62 Test Methods for Holiday Detection in Pipeline Coatings³

3. Summary of Test Method

3.1 Apparatus and materials are described whereby protective coatings on steel pipe are subjected to disbonding by an electrical stress. Specimens with intentionally damaged areas are buried in soil at an outdoor site and electrically connected to a magnesium anode. After test, the disbonded coating is removed, the exposed area measured, and comparisons are made to other specimens similarly exposed.

4. Significance and Use

4.1 Coated pipe is seldom, if ever, buried without some damage to the coating. Hence, an actual soil-burial test can contribute significant data, provided the method of testing is

controlled and the test specimen monitored and the relationship between the area disbonded, the current demand, and the mode of failure is fully understood.

4.2 Means are provided for measuring and following the electrical potential and current flow and relating these data to the final measurement of disbonded area.

5. Apparatus.

5.1 *Anode*—A standard packaged magnesium anode, minimum 4.082 kg (9 lb), with a factory-sealed, 4107-cmil (14-gage Awg) minimum, insulated copper wire shall be used. A solution potential of not less than -1.45 V with respect to a copper-copper sulfate reference electrode is required. Use sufficient anodes to maintain required potential.

5.2 *Connectors*—The wiring circuit from anode to test specimen and from specimen to reference electrode should be 4107-cmil (14-gage Awg) minimum insulated copper wire. Attach the wires to the test specimen as shown in Fig. 1 by soldering or brazing at the air-exposed end, and coat the place of attachment with insulating material. A junction box is optional for connecting the resistor in series between the anode and the test specimen.

5.3 The instruments used shall include the following:

5.3.1 *Voltmeter*, a suitable instrument such as a high impedance ($>10\text{M}\Omega$) analog multimeter having a sensitivity of $50\ 000\ \Omega/\text{V}$ minimum and a multiple range from 0.01 to 2 V for direct current is used for measuring the potential between specimen and the reference electrode,⁴ current between specimen and anode, and the resistance of the circuit. The same instrument shall be used for measuring current between specimen and anode. Alligator clips on the leads are permissible.

5.3.2 *Volt-Ohm-Meter* for measuring resistance of the circuit.

5.3.3 *Reference Electrode*, consisting of a copper-copper sulfate half cell in a conventional glass or plastic tube with porous plug construction, but preferably not over 19.05 mm ($3/4$ in.) in diameter, having a potential of -0.316 V with respect to a standard hydrogen electrode. A calomel electrode may be used, but measurements made with it should be converted to the copper-copper sulfate reference electrode for reporting, by adding -0.092 V to the observed reading.

¹ This test method is under the jurisdiction of ASTM Committee G-3 on Durability of Nonmetallic Materials and is the direct responsibility of Subcommittee G03.06 on Durability of Pipeline Coatings and Linings.

Current edition approved May 27, 1988. Published July 1988. Originally published as G 19-71 T. Last previous edition G 19-83.

² Annual Book of ASTM Standards, Vols 06.01 and 14.02.

³ Annual Book of ASTM Standards, Vol 14.02.

⁴ A pipe-to-soil Voltmeter-Ammeter, Agra Engineering Co., Tulsa, Okla., has been found suitable for this test.

FIG. 1. Three Specimens in a Circle with a Common Anode

5.3.4 A suitable instrument is used to measure the soil resistivity using the four-pin method.⁵ Pins should be spaced 762 mm (30 in.) apart.

5.3.5 *Thickness Gages*, to be used in accordance with Test Method G 12.

5.3.6 *Holiday Tools*—Holidays in the specimen are made with conventional drills of the required diameter. A 9.525-mm (0.375-in.) drill modified by substantially reducing the cone angle has been found effective in preventing perforation of thin-wall pipe or tubing. A sharp-pointed knife with a safe

handle is required for removing disbonded coatings to make physical examinations. A micrometer-type depth gage is used for measuring coating thicknesses at the edge of holidays.

5.3.7 *Holiday Detectors*—Selected in accordance with Test Method G 62.

6. Test Specimen

6.1 A 1219.2 mm (48-in.) long specimen shall be prepared with its surface preparation and coating procedures equivalent to that of production coated pipe. Only holiday-free specimens may be used in this test and four samples should be prepared.

⁵ A Vibroground instrument, Associated Research Inc., 3758 Belmont Ave., Chicago, Ill., has been found suitable for measuring soil resistivity.

6.2 Measure the coating thickness of all specimens at four points 90 deg apart and approximately 355.6 mm (14 in.) from each end.

6.3 Cap and seal one end of each specimen. Check the seal for current leakage before and after test by immersion in 1 percent sodium chloride solution for ½ h. Test with an ohmmeter sensitive to at least 1 MΩ.

6.4 Provide the unsealed end of the pipe with two lengths of insulated 4107-cmil (14-gage Awg) copper wire as in 5.2.

6.5 Make 3 holidays 304.8 mm (12 in.), 457.2 mm (18 in.), and 609.6 mm (24 in.), respectively, from the sealed end of the pipe by drilling holes through the coating so that the drill will fully enter the steel. The center holiday is to face the anode with the remaining two holidays facing 180 deg away from the anode. The drill diameter may not be less than two times the coating thickness, and never smaller than 9.525 mm (0.375 in.) in diameter. Do not perforate the steel wall of the pipe. With thin-wall steel pipe where there is danger of perforating the pipe, start the holiday with a standard 60-deg cone-point drill and finish with a substantially reduced cone-angle drill.

6.6 To prevent mechanical damage, apply a spiral wrap of suitable tape from approximately 152.4 mm (6 in.) from the top of the pipe specimen to 457.2 mm (18 in.) from the top. When the test specimens are buried, the taped area will extend 152.4 mm above and 152.4 mm below ground.

6.7 The specimen test area will consist of the area between the edge of the bottom end seal and the ground level. The bottom end-seal area is not considered part of the area tested. Any suitable diameter and length of pipe may be used, but the buried area should not be less than 23 227.2 mm² (36 in.²). An area of 93 000 mm² (1 ft²) has been found preferable.

7. Test Site

7.1 Any level location may be used, provided the site will not be disturbed for the duration of the test.

8. Procedure

8.1 Lay out the test site with stakes so that the anode location will be the center of a circle as shown in Fig. 1. Locate the pipe specimens 20° apart around the circumference so that the surface of the anode when placed in the center will be 609.6 mm (24 in.) from the nearest holiday of each specimen equally. Three specimens can thus be protected by one anode.

8.2 Installation of Test Specimens:

8.2.1 Dig suitable holes with an auger or posthole digger to accommodate the anode and test specimens at the test site.

8.2.2 Insert the anode at the center of the circle. The center of the anode should be 457.2 mm (18 in.) below ground. Pipe specimens should be inserted so that 304.8 mm (12 in.) are above the ground level, and oriented so that the single intentional holiday faces the anode and the remaining two holidays are 180 deg away from the anode. Maintain a distance of 609.6 mm (24 in.) between the surface of the anode and the nearest specimen and holiday.

8.2.3 Refill all holes with soil or a soil and water slurry. Firmly tamp the soil so that it is in intimate contact with the specimen and anode. No wood or other foreign material

should contact the pipe coating or the anode.

8.3 Electrical Measurements:

8.3.1 Determine in several areas the soil resistance in ohm-centimetres by the four-pin method.

8.3.2 Measure the initial pipe to soil potential with reference to a copper-copper sulfate half cell with the electrode 609.6 mm (24 in.) from the pipe as shown in Fig. 1. Record the closed-circuit potentials.

8.3.3 Connect the anode lead to one test specimen lead at the junction box with a 10 Ω ± 1 % wire-wound resistor connected in series between the anode and test specimen.

8.3.4 Measure the voltage, E , across the 10-Ω resistor, R , and convert to current, I as follows:

$$I = E/R = E/10$$

8.3.5 Measure the polarized potential, in volts with the analog multimeter described in 5.3.8 connected between the test specimen and the reference electrode as follows:

8.3.5.1 Disconnect the anode from the test specimen while closely observing the analog multimeter. As the instrument pointer falls, it will dwell significantly at the polarized value before receding further. The dwell point is the polarized potential.

8.3.6 Determine electrical measurements at 30-day intervals for a test period of 18 months or longer depending on soil conditions.

9. Report

9.1 The report shall include the following:

9.1.1 Complete identification of the test specimens, including name and code number of coating, size of the pipe, source, production date, production run number, and any other information that may be pertinent to identification.

9.1.2 Date of starting and of terminating the test.

9.1.3 Coating thickness of the test specimen before testing.

9.1.4 After subtracting the initial holiday areas, report the total disbonded area, average disbonded area, and disbonded area at each holiday in square millimetres (square inches) after testing.

9.1.5 Condition of the pipe surface under the disbonded coating.

9.1.6 Pipe-to-soil potentials, initial readings and at 30-day intervals.

9.1.7 Current readings between anode and pipe specimens, initial readings and 30-day intervals.

9.1.8 Soil resistivity readings in ohm-centimetres.

9.1.9 Polarized potentials, initial readings and 30-day intervals.

10. Precision

10.1 Precision data are limited to two adjacent specimens taken from the same production-coated pipe, assuming that the production process was uniform with respect to pipe surface condition and coating material. Specimens that were not adjacent in the as-produced condition, or were taken from different lengths of pipe may represent differing process conditions.

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 1916 Race St., Philadelphia, PA 19103.

Scope

1.1 This standard covers the use of the test method for the determination of the relationship between the reported and actual values of the test method. It is applicable to the use of the test method for the determination of the relationship between the reported and actual values of the test method.

References

Standard Test Method for Chemical Resistance of Pipeline Coatings¹

This standard is issued under the fixed designation G 20; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

Scope

1.1 This test method is intended for evaluating the resistance of pipe coating materials when exposed to various concentrations of reagents or suspected soil contaminants. The test serves as a guide to investigators wishing to compare the relative merits of pipe-coating materials in specific environments. The choice of reagents, concentrations, duration of immersion, temperature of test, and properties to be reported are necessarily arbitrary and should be chosen to reflect conditions known to exist along the pipeline right-of-way.

1.2 *This test method may involve hazardous operations and equipment. This test method does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of this test method to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

2.1 ASTM Standards:

- D 543 Test Method for Resistance of Plastics to Chemical Reagents²
- D 883 Definitions of Terms Relating to Plastics²
- G 8 Test Methods for Cathodic Disbonding of Pipeline Coatings³
- G 12 Test Method for Nondestructive Measurement of Film Thickness of Pipeline Coatings on Steel³
- G 17 Test Method for Penetration Resistance of Pipeline Coatings (Blunt Rod)³

3. Summary of Test Method

3.1 This test method consists of an immersion-type test in a closed container where coated pipe specimens are in long-term contact with both the liquid and vapor phase of the test reagent. Specimens exposed in this manner are inspected for visible signs of chemical attack. Subsequent tests for cathodic disbonding in accordance with Test Method G 8, or penetration under load in accordance with Test Method G 17, may be applied to determine if the specimens have undergone any loss of mechanical or bonding properties.

4. Significance and Use

4.1 The data obtained for short-term tests are of interest

only in eliminating the most unsuitable materials or for indicating a probable order of resistance in any particular media.

4.2 Test conditions should take into account the manner and duration of immersion, the reagent, the temperature of the system, the area exposed above and below the liquid level, and other performance factors selected for the particular test.

5. Apparatus

5.1 *Thickness Gage*, capable of measuring the coating thickness in the manner prescribed by Test Method G 12.

5.2 *Test Container*—A transparent closed container, sized to completely encase the pipe specimen and large enough to provide adequate exposure to both the liquid and vapor states of reagent.

NOTE 1—For example, a 2-L (2.0-qt) capacity, Mason-type jar with a 70-mm (2.75-in.) diameter neck has been found suitable for use with 2 in. pipe and is illustrated in Fig. 1.

5.2.1 To avoid pressure build-up within the test containers, the threaded cup shall be replaced with a solid-rubber stopper. A positive venting device, such as a water seal, shall be used when testing with volatile solvents at elevated temperatures.

5.2.2 A separate container shall be used for each test specimen.

5.3 *Oven or Constant-Temperature Room or Bath*—To ensure uniformity of test results, the test cells and specimen shall be maintained at the test temperature $\pm 5^\circ\text{C}$ (9°F) over the duration of the test period.

5.4 *Auxiliary Testing Devices*—Supplemental equipment used to determine specific mechanical properties of specimens before and after immersion shall conform to the requirements prescribed in the applicable ASTM test method.

6. Test Specimen

6.1 The test specimen shall be prepared with its surface preparation and coating procedures equivalent to that of coated pipe. A control specimen shall be retained for comparison.

6.2 In order to utilize the test container specified in 4.2, the pipe specimen, with end caps, shall be restricted to a maximum overall length of 180 mm (7.0 in.) and a diameter of 65 mm (2.5 in.).

6.3 Both ends of the pipe specimens shall be plugged with inert stoppers and coated with an epoxy-base coating material.

6.4 Specimens with Holidays:

6.4.1 A holiday shall be made in the surface of the coated pipe specimen at a point 25 % of the distance between the

¹ This test method is under the jurisdiction of ASTM Committee G-3 on Durability of Nonmetallic Materials and is the direct responsibility of Subcommittee G03.06 on Durability of Pipeline Coatings and Linings.

³ Annual Book of ASTM Standards, Vols 06.01 and 14.02.

end caps. It shall be made by drilling a radial hole through the coating so that the angular cone point of the drill will fully enter the steel where the cylindrical portion of the drill meets the steel surface. The drill diameter shall not be less than three times the coating thickness, but it shall never be smaller than 6 mm (0.25 in.) in diameter. The steel wall of the pipe shall not be perforated.

6.4.2 A second identical holiday shall be drilled into the coating surface at a point 25 % of the distance between the end caps of the specimen (see Fig. 1). Both holidays should lie in the same pipe axis.

6.5 Specimens without intentional holidays shall also be prepared for testing.

NOTE 2—Intentional holidays shall be made in only those specimens for which a comparison of disbonding properties is desired. Other samples used for supplemental mechanical testing shall be run without holidays.

7. Reagents

7.1 The reagents selected for coating-resistance tests should be those anticipated to occur in the environment or in the product being carried in the pipeline at the temperatures and in the concentrations expected. The numbers in parentheses refer to the list of standard reagents given in Section 4 of Test Method D 543.

- 7.1.1 Acetic Acid (5 %) (4.4.2).
- 7.1.2 Acetone (4.4.3).
- 7.1.3 Carbon Disulfide.
- 7.1.4 Gasoline.
- 7.1.5 Hydrochloric Acid (10 %) (4.4.23).
- 7.1.6 Kerosine (4.4.28).
- 7.1.7 Lime Water, Saturated.
- 7.1.8 Methyl Alcohol (4.4.29).
- 7.1.9 Methyl Ethyl Ketone.
- 7.1.10 Nitric Acid (10 %) (4.4.33).
- 7.1.11 Sodium Carbonate Solution (20 %) (4.4.38).
- 7.1.12 Sodium Chloride Solution (10 %) (4.4.40).
- 7.1.13 Sodium Hydroxide Solution (10 %) (4.4.42).

NOTE—Dimensions shown for 2 in. IPS pipe.

FIG. 1 Chemical Immersion Test Schematic of Test Cell

- 7.1.14 Sulfuric Acid (30 %) (4.4.46).
- 7.1.15 Toluene (4.4.48).
- 7.1.16 Transformer Oil (4.4.49).
- 7.1.17 Trichlorethylene.
- 7.1.18 Other selected environments.

8. Precautions

8.1 Safety precautions should be taken to avoid personal contact, to eliminate toxic vapors, and to guard against explosion hazards in accordance with the hazardous nature of the particular reagents being used.

9. Procedure

9.1 Place a single specimen in a vertical position in each test container.

9.2 Fill the container with the selected reagent so that the liquid level covers one half of the coated pipe specimen up to a point midway between the two intentional holidays. Stopper the 704 Container to prevent evaporation of the reagent and against contamination.

9.3 Maintain the reagent level at the original level.

9.4 The basic immersion test for a particular coating material shall consist of twelve specimens, six with holidays and six without, each in an individual test cell. Remove duplicate samples of each from the test at 30, 60, and 90 day intervals. Additional investigations of pre- and post immersion mechanical properties will require additional specimens. It is recommended that in all cases provisions be made for duplicate test specimens.

9.5 Remove the specimen after 30, 60, and 90 days of immersion. Wash with running water all specimens removed from acid, alkali, or other aqueous solutions and wipe them dry with a soft, clean, cotton cloth or paper tissue. Specimens removed from volatile solvents such as acetone, alcohol, etc., need no rinsing before wiping dry.

9.6 Observe and report before, immediately after, and 2 h later the appearance of specimen after exposure to reagent on the basis of visual examination for evidence of loss of gloss, developed texture, decomposition, discoloration, softening, swelling, injury, bubbling, blistering, cracking, solubility, etc. as defined in D 883.

9.7 Mechanically probe each of the intentional holidays in accordance with Section 8.3.3 of Test Method G 8 to see if there has been any loss of coating bond during the test period.

9.8 Perform other planned mechanical tests to determine if any degradation of coating properties has occurred through reagent exposure.

10. Report

- 10.1 The report shall include the following:
 - 10.1.1 Complete identification of the material tested, including type, source, manufacturer's code, and previous history,
 - 10.1.2 Method of preparing test specimen,
 - 10.1.3 Temperature of test,
 - 10.1.4 Description of media, including ASTM designation,
 - 10.1.5 Duration of immersion,
 - 10.1.6 Outside diameter of test specimen,
 - 10.1.7 Initial thickness of coating,

- 0.1.8 General appearance of specimen after immersion,
- 0.1.9 Immersion area in square millimetres (square inches),
- 0.1.10 Vapor phase area in square millimetres (square inches), and
- 0.1.11 Disbonded area after immersion in square millimetres (square inches).

11. Precision and Bias

11.1 As there are no direct measurements involved with this test method, no precision and bias statement is necessary. Measurements made by procedures for other test methods should refer to the precision and bias statements therein.

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 1916 Race St., Philadelphia, PA 19103.

Standard Practice for Operating Light-Exposure Apparatus (Carbon-Arc Type) With and Without Water for Exposure of Nonmetallic Materials¹

This standard is issued under the fixed designation G 23; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense. Consult the DoD Index of Specifications and Standards for the specific year of issue which has been adopted by the Department of Defense.

1. Scope

1.1 This practice covers the basic principles and operating procedures for light-exposure apparatus with and without water spray employing a carbon-arc light source.

1.2 This practice does not specify the exposure conditions best suited for the material to be tested. It is limited to the method of obtaining, measuring, and controlling the conditions and procedures of the exposure. Sample preparation, test conditions, and evaluation of results are covered in ASTM test methods or specifications for specific materials.

NOTE 1—Attention is called to the following test methods and practices for more information on use of this practice for specific materials:

Practices D 529, D 822, D 904, D 1499, D 3361, D 3815, E 765 and Test Methods C 732, C 734, C 741, D 750, D 3424 and D 3583.

1.3 This practice includes four procedures:

1.3.1 *Method 1*—Continuous exposure to light and intermittent exposure to water spray.

1.3.2 *Method 2*—Alternate exposure to light and darkness and intermittent exposure to water spray.

1.3.3 *Method 3*—Continuous exposure to light without water spray. Specific exposure conditions for testing fabric are found in AATCC Test Method 16A.

1.3.4 *Method 4*—Alternate exposure to light and darkness without water spray.

1.4 The values stated in SI units are to be regarded as the standard. The inch-pound unit equivalents of the SI units may be approximate.

1.5 *This standard does not purport to address the safety problems associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

FIG. 1 Report Form

2.3 ISO Standard.¹² ISO Gray Scale

3. Significance and Use

3.1 Several types of apparatus with different exposure conditions are available for use. No single operating procedure for light exposure apparatus with or without water can be specified as a direct simulation of natural exposure. This practice does not imply expressly or otherwise an accelerated weathering test.

3.2 Since natural environments vary with respect to geography, topography, and different exposure periods, it may be expected that the effects of natural exposure will vary accordingly. Furthermore, all materials are not affected equally by the same environment. Therefore, results obtained by use of this practice should not be represented as equivalent to those of any natural weathering test until the degree of quantitative correlation has been empirically established for the material in question.

3.3 Variations in results may be expected among instruments of different types and when operating conditions among similar type instruments vary within the accepted limits of this practice. Therefore, no reference should be made to results from use of this practice unless accompanied by the report form as specified in Fig. 1.

4. Apparatus¹³

4.1 The apparatus employed shall use one or two carbon-arc lamps as the source of radiation, and shall be one of the following types, or equivalent. The term "cycle" is defined as the total time for all exposure conditions (light, light plus water spray, dark periods) that are repeated.

NOTE 2—Several models of carbon-arc type exposure devices are no longer commercially available and should be considered obsolete. Exposures in these devices are not recommended and should only be made when mutually agreed upon by all interested parties.

4.1.1 *Type D*—Twin enclosed carbon-arc lamp apparatus, with a 762 mm (30 in.) diameter specimen drum rotating at 1 rpm, automatic control of temperature and cycle, and manually adjusted humidifier.

4.1.2 *Type DH*—Same as Type D, except with automatic control of the humidity.

4.1.3 *Type E*—Single open-flame sunshine carbon-arc lamp apparatus, with a 959 mm (37.75 in.) diameter specimen rack rotating at 1 rpm, automatic control of temperature and cycle, and manually adjusted humidifier.

4.1.4 *Type EH*—Same as Type E, except with automatic control of the humidity.

4.1.5 *Type H*—Single enclosed carbon-arc lamp apparatus, with a 508 mm (20 in.) diameter specimen rack, rotating at 1 rpm, automatic control of temperature and cycle, and manual regulation of the humidity.

4.1.6 *Type HH*—Same as Type H, except with automatic control of the humidity.

4.2 The apparatus should consist of a suitable frame within which is located a test chamber, and necessary compartments for housing control and regulating equipment.

4.3 Provision should be made for mounting or supporting the test specimens in a circular rack or drum that is rotated around the arc or arcs. This provides uniform distribution of the radiation on all specimens around the circumference of the rack. It does not, however, improve the distribution of the radiation along the vertical axis.

4.4 Adequate ventilation should be provided in the test chamber to prevent contamination of the specimens from combustion products of the arc.

4.5 The apparatus should include equipment necessary for measuring and controlling the following:

4.5.1 Arc current,

4.5.2 Arc voltage,

4.5.3 Black-panel temperature (Note 3),

¹² Available from American National Standards Institute, 1430 Broadway, New York, NY 10017.

¹³ Available from the Atlas Electric Devices Co., 4114 N. Ravenswood Ave., Chicago, IL 606132 and from Suga Test Instruments Co., Ltd. 4-14, Shinjuku 5-chome, Shinjuku-ku, Tokyo, 160, Japan.

FIG. 2 Black Panel Thermometer Unit Using Dial Type Thermometer

4.5.4 Water-spray pressure,
4.5.5 Operating schedule or cycle,
4.5.6 Exposure time, and
4.5.7 Relative humidity (Types DH, EH, and HH only).
4.6 Types DH, EH, and HH apparatus are equipped with thermostatically actuated vaporizing units for adding moisture to the air as it passes through the conditioning chamber prior to its entry into the test chamber. Type H and some Types D, and E have manually regulated, electrically operated vaporizing units. Relative humidity of the air in the test chamber is calculated from the readings of the wet- and dry-bulb thermometers, either indicating or reporting, whose sensing portion is located in the air stream at its point of exit from the test chamber.

4.7 The black-panel thermometer unit should consist of a stainless steel panel 1 by 70 by 150 mm (.060 by 2.75 by 5.875 in.) to which is mechanically fastened a temperature sensing device. This device shall be capable of measuring temperature to a repeatability of $4 \pm 1^\circ\text{C}$ (see Figs. 2 and 3). The face of the panel with the temperature sensing device attached should be finished with two coats of baked-on black enamel selected for its resistance to light and water.

4.8 Detailed requirements and operating conditions of the apparatus are given in Table 1 and Figs. 4 to 6.

5. General Procedure

5.1 Prepare specimens of a suitable size and shape for mounting in the drum or rack of the apparatus in accordance

with the detailed requirements specified for the material to be tested.

5.2 Mount the test specimens, except those whose shape or other physical characteristics make it impractical, vertically both above and below the horizontal center line of the source of radiation. To assure that specimens receive the greatest uniformity of radiant exposure, reposition them vertically in a sequence which will provide each specimen equivalent exposure periods in each location. When the exposure interval does not exceed 24 h, each specimen should be located equidistant from the horizontal axis of the arc. For exposure intervals not exceeding 100 h, daily rotation of the specimens is recommended. Other methods of achieving uniform total irradiation may be employed if mutually agreed upon by concerned parties.

5.3 For enclosed arcs only, where physical characteristics do not permit suspension of specimens in a vertical position, expose them horizontally on a rack 165 mm (6.5 in.) below the horizontal center of the source or sources of radiation. Mount the specimens on a circular horizontal rack equipped with turntables, so that each specimen is rotated on its own axis as all of the specimens are rotated around the source or sources of radiation.

5.4 Temperature measurement and control should be based on the black-panel thermometer unit. Support the panel with the thermometer attached in the specimen drum or rack in the same manner as the test specimens so that it will be subjected to the same influences.

FIG. 3 Black Panel Thermometer Unit Using RTD Thermocouple Sensor

5.4.1 Program the instrument to operate in a continuous light-on mode. Fill specimen rack with blanks and the black-panel thermometer. Operate in this mode while establishing the black-panel temperature according to the manufacturer's instructions. Allow the machine to come to operating temperature and equilibrate (allow 4 h of continuous running time and between 25 to 35 min after a spray cycle). Unless other temperatures and tolerances are specified in the applicable ASTM test method or detailed material specifications, the black-panel temperature shall be $63 \pm 2.5^\circ\text{C}$ ($145 \pm 5^\circ\text{F}$) (Note 3).

5.4.2 Compare the black-panel temperature with the specification. If the black-panel temperature is within 2.5°C or 5°F of specification, no adjustment is necessary. If the observed temperature difference is greater than 2.5°C or 5°F , adjust the temperature controller and recheck the black-panel temperature during the next cycle. It is recommended that this procedure be performed after every 200 h of machine operation.

NOTE 3—Where desired, other black-panel temperatures may be employed provided they are specifically noted in the report of test results. Instructions for adjusting the intensity of the arc and the fading rate are supplied with the apparatus or are available upon request from the manufacturer. Consideration should always be given to installing the instrument in a room where the temperature and humidity conditions are controlled. The magnitude of the effects due to variation in the air

supply can only be partially determined when the intake air is not controlled.

5.5 The water from the specimen spray should strike the test specimens in the form of a fine spray equally distributed over the test specimens. Unless otherwise specified in the applicable ASTM test method or detailed material specification, the water pressure, number, and type of nozzles should be in accordance with the detailed requirements for the various types of apparatus as indicated in Figs. 4 to 6. The pH of the water shall be 6.0 to 8.0, contain less than 1 ppm solids and leave no objectional deposits or stain on the specimens. The presence of very low levels of silicates in spray water has been shown to leave deposits on some specimens. It is recommended that the temperature of the water should be $16 \pm 5^\circ\text{C}$ ($60 \pm 9^\circ\text{F}$). Recirculation is not recommended and must not be done unless the recirculated water is treated to meet the above requirements.

5.5.1 Set the cycle control unit cam until the machine is in a spray cycle. Observe the spray manifold. All spray heads should spray a stream of mist or water which reaches the panel surface. If any of the spray heads are not satisfactory, remove the spray manifold and clean each spray head. Install the manifold and recheck the spray operation.

5.6 The flat glass filter panes used in Types E or EH devices cannot be used for more than 2000 h. Monitor age and position of the filter panes so that the oldest can be

PINTS OF WATER PER MINUTE FROM SPECIMEN SPRAY UNIT EQUIPPED WITH 4 NOZZLES OPERATED AT A NOZZLE PRESSURE OF 12 TO 18 PSI: NO.50 NOZZLE - 4.4 TO 5.2 PINTS/MIN

mm	3.3	34.9	92.1	101.6	293.2	762	83 to 124 kPa	2.5 to 2.9 dm ³
in.	1/8	1 3/8	3 5/8	4	11 5/16	30	12 to 18 psi	4.4 to 5.2 pt

FIG. 4 Specimen Spray Arrangement for Types D and DH Apparatus

removed every 250 h. Filter globes used in type D or DH devices cannot be used for more than 2000 h. Replace the oldest of the filter globes every 1000 h. Replace the filter globe in Type H or HH devices after 2000 h of use or when pronounced discoloration or milkiness develops. Clean filters each day by wiping with a clean, dry non-abrasive cloth or towel. Filters can also be cleaned by washing with water, or a solution of detergent and water.

5.7 Unless otherwise specified in the applicable ASTM test method or detailed material specifications, operate Types E and EH apparatus with the filters in place and with the carbon electrodes specified in Table 1. If operated without filters or with other types of carbon electrodes, state this in the report of test results.

METHOD 1—CONTINUOUS EXPOSURE TO LIGHT AND INTERMITTENT EXPOSURE TO WATER SPRAY

6. Apparatus

6.1 The apparatus may be any of the recommended type equipped with water spray nozzles.

6.2 Program the instrument for continuous light and intermittent water spray according to the manufacturer's instructions. Since there are numerous light and water spray

cycles which can be used, the cycle program selected must be by mutual agreement among the interested parties. Historical convention has established a cycle of 102 min of light followed by 18 min of light and water spray. This cycle permits the attainment of the maximum black-panel temperature during the light only portion of the exposure.

6.2.1 When testing the effects of photodegradation only, the water spray may be omitted (refer to Method 3).

6.3 In Types DH, EH and HH apparatus, dry and wet bulb temperature controls, humidifier and immersion heater controls should be adjusted as specified.

6.4 In Type H and in Types D and E with humidifier, humidity may be adjusted but not controlled.

METHOD 2—ALTERNATIVE EXPOSURE TO LIGHT AND DARKNESS AND INTERMITTENT EXPOSURE TO WATER SPRAY

7. Apparatus

7.1 The apparatus shall be Type DH, EH and HH apparatus with automatic humidity control and water spray nozzles.

7.2 Operation during the light on period should be as described in Section 5.

FIG. 5 Specimen Spray Arrangement for Types E and EH Single Open-Flame Sunshine Carbon-Arc Lamp Apparatus

7.2.1 Separate controls for temperatures and humidification may be adjusted during the dark period for automatic control as the cycle alternates from light to dark. In Type EH apparatus, a spray rack to cool the specimens by wetting the unexposed back surface can result in development of condensation on the exposed specimen surface during the dark interval.

7.3 All Types DH, EH, H, HH and some Type D, and E may be programmed to operate with alternating light and dark intervals without control of relative humidity.

METHOD 3—CONTINUOUS EXPOSURE TO LIGHT WITHOUT WATER SPRAY

8. Apparatus

8.1 The apparatus shall be Type D or DH, E or EH, H or HH light-exposure devices programmed for continuous light only, according to the manufacturer's instructions.

8.2 Adjust the controls on the apparatus so that the black panel temperature is $63 \pm 2.5^{\circ}\text{C}$ ($145 \pm 5^{\circ}\text{F}$) (Note 3), and for a relative humidity of $30 \pm 5\%$ in devices with automatic humidity control.

8.3 Expose the materials to be tested as determined by mutual agreement among the concerned parties or, when not otherwise specified, in accordance with one of the following:

8.3.1 Versus One AATCC Blue Wool Lightfastness Standard—Expose the test specimen and any mutually agreed upon AATCC Blue Wool Lightfastness Standard partially masked until the difference between its masked and unmasked portion exhibits a color change equal to Step 4 of the ISO Gray Scale. Report the results by any mutually agreed-upon method of measuring change in the test specimen.

8.3.2 Versus Set of AATCC Blue Wool Lightfastness Standards—Expose the test specimen and a set of AATCC Blue Wool Lightfastness Standards partially masked until a maximum permissible amount of change, as determined by specified or mutually agreed-upon method of measurement, occurs in the test specimen. Assign it a classification number equal to that of the numbered standard that most nearly exhibits a change in color equal to Step 4 on the ISO Gray Scale. Where one standard shows a color change greater than Step 4 and the next higher number standard shows less than a Step 4 color change, an intermediate or half-grade rating may be used.

FIG. 6 Specimen Spray Arrangement for Types H and HH Single Enclosed Carbon-Arc Lamp Apparatus

8.3.3 *Versus Other Standard Sample*—Expose the test specimen and any mutually agreed-upon standard sample until either shows an agreed-upon amount of change when measured by any mutually agreed-upon method. Report the results on the basis of a comparison of the specimen with the standard sample.

METHOD 4—ALTERNATE EXPOSURE TO LIGHT AND DARKNESS WITHOUT WATER SPRAY

9. Apparatus

9.1 The apparatus shall be Type H or HH programmed to a predetermined cycle of light and darkness by turning off

FIG. 7 Representative UV Transmission Curves for 2.5 mm and 3 mm Filter Glasses^A

^A # 7058 Corex is a tradename for a potash lithia borosilicate glass.

^B #7740 Pyrex is a tradename for a soda borosilicate glass.

the carbon arc.

9.2 The procedure for Method 4 is the same as specified for Method 3 except that the following light-dark interval shall replace the continuous light condition of Method 3.

9.2.1 Unless otherwise specified by the detailed requirements for the type of material being tested, adjust the controls of the apparatus so that it produces a cycle of 1 h of darkness followed by 3.8 h of light. Repeat this cycle for the duration of the test. During the light-on period the black-panel temperature, at equilibrium, shall be $63 \pm 2.5^\circ\text{C}$ ($145 \pm 5^\circ\text{F}$). During the period while the light is off, the black-panel temperature will progressively drop until it is in equilibrium with the air in the test chamber. The relative humidity of the air at the face of the test specimens will progressively rise during the light-off period until equilibrium is reached.

10. Report

10.1 The report shall include the following:

- 10.1.1 Type and model of exposure device,
- 10.1.2 Type of light source,
- 10.1.3 Type, thickness, and age of filters,
- 10.1.4 Elapsed exposure time,
- 10.1.5 Light and dark-water-humidity cycle employed,
- 10.1.6 Operating black-panel temperature,
- 10.1.7 Operating relative humidity,
- 10.1.8 Type of spray water,
- 10.1.9 Type of spray nozzle, and
- 10.1.10 Specimen relocation procedure.

APPENDIX

(Nonmandatory Information)

X1. OBSOLETE APPARATUS

X1.1 The following types of apparatus are no longer commercially available and should be considered obsolete. Although existing units may be operated in accordance with

Methods 1 and 3 of this practice, results may not be comparable with those obtained in superseding models.

X1.1.1 *Type A*—Single enclosed carbon-arc lamp apparatus*

with a 762 mm (30 in.) diameter specimen drum rotating at 1 rpm, automatic control of temperature and cycle, and no automatic control of the humidity.

X1.1.2 *Type AH*—Same as Type A, except with automatic control of humidity.

X1.1.3 *Type B*—Single enclosed carbon-arc lamp apparatus, 3 RPH, 762 mm (30 in.) diameter specimen drum, automatic temperature control, no automatic humidity con-

trol. Last manufactured in 1955.

X1.1.4 *Type C*—Same as Type B but without automatic temperature control. Last manufactured in 1960.

X1.1.5 *Type F*—Single open flame carbon arc lamp apparatus, 0.5 rph, 960 mm (37.75 in.) diameter specimen rack with vertical specimen mounting. No automatic control of temperature or humidity. Last manufactured in 1950.

X1.1.6 *Type G*—Same as Type F but with inclined specimen rack.

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 1916 Race St., Philadelphia, PA 19103.

Standard Practice for Operating Light-Exposure Apparatus (Xenon-Arc Type) With and Without Water for Exposure of Nonmetallic Materials¹

This standard is issued under the fixed designation G 26; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This practice covers the basic principles and operating procedure for water- or light-exposure apparatus, or both, employing a xenon-arc light source.

NOTE 1—This practice combines the practices previously referred to as G 26 and G 27. Practice G 27, for Operating Xenon-Arc Type Apparatus for Light Exposure of Nonmetallic Materials², has been discontinued since it is now covered in this edition of G 26 under Test Methods C and D.

1.2 This practice does not specify the exposure conditions best suited for the material to be tested, but is limited to the method of obtaining, measuring, and controlling the conditions and procedures of the exposure. Sample preparation, test conditions, and evaluation of results are covered in ASTM methods or specifications for specific materials.

1.3 This practice includes four test methods:

1.3.1 *Test Method 1*—Continuous exposure to light and intermittent exposure to water spray.

1.3.2 *Test Method 2*—Alternate exposure to light and darkness and intermittent exposure to water spray.

1.3.3 *Test Method 3*—Continuous exposure to light without water spray. Exposure conditions are characteristic of those specified by AATCC Test Method 16E 1976.

1.3.4 *Test Method 4*—Alternate exposure to light and darkness without water spray. Exposure conditions characteristic of those natural conditions experienced when exposing are in accordance with Practice G 24.

1.4 *This practice may involve hazardous operations and equipment. This practice does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of this practice to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

1.5 The values stated in SI units are to be regarded as the standard. The inch-pound equivalents of the SI units may be approximate.

2. Referenced Documents

2.1 ASTM Standard:

G 24 Practice for Conducting Natural Light Exposures Under Glass²

2.2 AATCC Standard:

Method 16E 1976 Colorfastness to Light, Water, and Xenon-Arc Lamp Continuous Light³

2.3 CIE Standard:

No. 20 Recommendations for the Integrated Irradiance and the Spectral Distribution of Simulated Solar Radiation for Testing Purposes⁴

2.4 ISO Standard:

Gray Scale

3. Significance and Use

3.1 Several types of apparatus with different exposure conditions are available for use. No single operating procedure for light-exposure apparatus with and without water can be specified as a direct simulation of natural exposure. This practice does not imply expressly or otherwise an accelerated weathering test.

3.2 Since the natural environment varies with respect to time, geography, and topography, it may be expected that the effects of natural exposure will vary accordingly. All materials are not affected equally by the same environment. Results obtained by use of this practice should not be represented as equivalent to those of any natural weathering test until the degree of quantitative correlation has been established for the material in question.

3.3 Variations in results may be expected among instruments of different types or when operating conditions among similar type instruments vary within the accepted limits of this practice. Therefore, no reference should be made to results from use of this practice unless accompanied by the report form shown in Fig. 1 or unless otherwise specified in referenced procedure.

4. Apparatus

4.1 Water-Cooled Type:⁵

4.1.1 The apparatus employed should utilize a water-cooled xenon-arc lamp as the source of radiation and should be one of the following general types, or their equivalent:

4.1.1.1 *Type A*—An exposure apparatus in which the source of radiant energy shall be a water-cooled xenon-arc lamp vertically located at the central axis of either a 508-mm (20-in.) diameter vertical specimen rack, or of a 648-mm (25.5-in.) diameter inclined rack. Means shall be provided for automatic programming of temperature and cycles.

¹ This practice is under the jurisdiction of ASTM Committee G-3 on Durability of Nonmetallic Materials and is the direct responsibility of Subcommittee G03.03 on Simulated and Controlled Environmental Tests.

Current edition approved Jan. 26, 1990. Published March 1990. Originally published as E 239 - 64 T. Redesignated G 26 in 1970. Last previous edition G 26 - 88¹.

FIG. 1 Report Form

Means shall be provided for adjustment of relative humidity. The specimen rack shall rotate at 1 ± 0.1 rpm.

NOTE 2—In the commercial descriptions of the four types, the term "cycle" is defined as each time interval of light, darkness, and water spray that is specified differently in accordance with the different testing methods.

4.1.1.2 Type AH—The exposure apparatus shall be identical to Type A except it shall have automatic humidity control.

4.1.1.3 Type B—An exposure apparatus in which the source of radiant energy shall be a water-cooled xenon-arc vertically located at the central axis of a 960-mm (37.75-in.) diameter specimen rack. Means shall be provided for automatic programming of temperature and cycles. Means may be provided for adjustment of humidity. The specimen rack shall rotate at 1 ± 0.1 rpm.

4.1.1.4 Type BH—The exposure apparatus shall be similar to Type B except it shall have automatic humidity control.

4.1.2 The xenon-arcs employed shall be of the "long arc" water-cooled type operated through suitable reactance transformers and electrical equipment from a 50 or 60-Hz power supply. They shall employ cylindrical inner and outer optical filters to direct the flow of cooling water and to simulate a designed spectral energy distribution.

4.1.2.1 For the purpose of this practice, the xenon-arc lamp shall consist of a quartz xenon burner tube and one of the following optical filter combinations:^{6,7}

(a) Borosilicate glass inner and outer optical filter to simulate the spectral power distribution (SPD) of natural daylight throughout the actinic region.

(b) Infrared absorbing glass inner optical filter with quartz outer optical filter to simulate the SPD of natural daylight (300 to 1000 nm).

(c) Borosilicate glass inner optical filter with soda lime glass outer optical filter to simulate the SPD of natural daylight (actinic wavelengths) filtered through window glass.

(d) Infrared absorbing glass inner and outer optical filter to simulate the SPD of natural daylight (310 to 1000 nm) filtered through window glass.

(e) Quartz inner and outer optical filter to approximate sunlight intensities unfiltered by the earth's atmosphere.⁶

4.1.2.2 To prevent loss in levels of irradiance due to excessive solarization and to prevent possible breakage caused by stresses in optical filters exposed to high-intensity UV energy, inner optical filters⁸ shall be replaced periodically. Suggested intervals are 300 and 400 h for Types A and B, respectively. The outer optical filter shall be replaced after 1500 and 2000 h for Types A and B, respectively.

4.1.3 Distilled or deionized water should be recirculated past the burner at a flow rate sufficient to remove excess heat. Passing water through a cartridge demineralizer installed in the recirculation line just ahead of the lamp minimizes contamination of the quartz envelope of the burner. A heat-exchange unit should be used to cool the recirculated lamp water.

4.1.4 Since xenon-arc lamps, like all gas discharge lamps, will have a progressive drop in radiation output with continued use, and since optical filters will change in their

⁶ Norton, Kuntke, and Connor, *Canadian Textile Journal*, CTJOA, May 1969.

⁷ Corning 7740 Pyrex® (borosilicate), Corning 4601 IR absorbing visible transmitting, Kimble R6 soda lime glass tubing, and General Electric GA-204 quartz tubing of proper dimensions have been found suitable for use as xenon-arc optical filters. Available from Atlas Electric Devices Co., 4114 N. Ravenswood Ave., Chicago, IL 60613.

⁸ Kishii, T., and Ooka, K., *Symposium on Coloured Glasses*, International Comm. on Glass of Czech. Sci. & Tech. Soc. of the Silicate Industry, 1967.

transmission characteristics, provision shall be made in the apparatus (automatically or manually) for progressively increasing the wattage of the lamp to minimize changes in the intensity of the radiation at the face of the sample. The greatest change in both the xenon burner tube and optical filters occurs in the first 20 h of use. For this reason, burners and optical filters preaged by the instrument manufacturer are recommended for critical testing when a more rapidly changing rate of intensity is undesirable. For routine testing on a comparative basis, the 20 h of preaging may be omitted.

4.1.5 Many nonmetallic materials are selectively absorbing. The energy that a molecule absorbs depends upon the wavelength of the incident radiation.⁹ It is desirable to monitor the level of irradiance of the photochemically effective wavelengths if intercomparisons are to be made among samples not exposed simultaneously. Samples may then be exposed to known amounts of irradiation, the time integral of irradiance.

4.1.5.1 Where radiometers capable of monitoring discrete portions of a continuous spectrum are available, exposure to a mutually agreed-upon level of irradiation may be specified as the exposure interval in place of a time interval.

(a) When using the optical filter combination described in 4.1.2.1 (a), the suggested minimum spectral irradiance levels are:

- .2 W/m²/nm band at 320 nm
- .35 W/m²/nm band at 340 nm
- .5 W/m²/nm band at 380 nm
- .75 W/m²/nm band at 420 nm

(b) When using the optical filter combination described in 4.1.2.1 (c), the suggested minimum spectral irradiance levels are:

- .2 W/m²/nm band at 340 nm
- .45 W/m²/nm band at 380 nm
- .7 W/m²/nm band at 420 nm

(c) Operating at the suggested minimum levels approximates the average daily solar irradiance under ideal conditions. It is about half of the maximum values for total irradiance on a horizontal plane when the sun is at 90° altitude as reported in CIE No. 20. When irradiance is monitored and periodic manual adjustment of wattage is made to compensate for changes of intensity, no lamp assembly should be used that cannot maintain the minimum level of irradiance within a 10 % tolerance at the monitored wavelength. Irradiation expressed as joules per square metre is the product of irradiance × exposure time in seconds.

4.1.5.2 Xenon-arc type equipment not having a radiometer shall be operated with periodic increases in wattage to minimize any drift in levels of irradiation. Such intervals shall be established by the parties concerned or follow the suggested schedule below in 4.1.5.2 (a).

NOTE 3—The use of suggested wattage steps does not imply that irradiance will be maintained at levels equivalent to those obtained when employing a light monitor. They are intended as a guide to minimize the reduction of UV intensity with maximum lamp longevity when using either Test Method A or C for 2.5, 6, or 6.5-kW lamps, respectively.

⁹ Hawkins, W.L., ed., "Polymer Stabilization," Wiley-Interscience, 1972. p. 166.

(a) The following are the suggested wattage settings for each exposure interval of a 2500-W xenon burner tube based upon the average performance of xenon burner tubes with borosilicate filters:

Time, h	Power, W
0 to 20	1600
20 to 200	1800
200 to 400	2000
400 to 600	2250
600 to 800	2500
800 to 1000	2600
1000 to 1200	2800
1200 to 1500	3000

(b) The following are the suggested wattage settings for each exposure interval of a 6000-W xenon burner tube based upon the performance of xenon burner tubes with borosilicate filters in Test Method A:

Time, h	Power, W
0 to 20	min
20 to 100	4750
100 to 250	5000
250 to 400	5250
400 to 550	5500
550 to 700	6000
700 to 850	6500
850 to 1000	7000

(c) The following are the suggested wattage settings for each exposure interval of a 6500-W xenon burner tube based upon the average performance of xenon burner tubes with borosilicate filters in Test Method A:

Time, h	Power, W
0 to 20	min
20 to 100	5500
100 to 200	6000
200 to 500	6200
500 to 1000	6500
1000 to 1500	7000
1500 to 2000	7500
2000 and over	8500

4.1.6 Specimens should be mounted on a rack rotating about the lamp at a distance such that the location of each specimen assures that the irradiance incident on its surface does not vary by more than 5 % from the average. Figure 4 illustrates a rack meeting this condition.

4.1.7 Any apparatus that does not comply with the condition of 4.1.6 shall not have a variation in irradiance exceeding 10 % of the average, and may require specimen rearrangement during exposure, in accordance with the test procedure, in order to minimize the variability in radiant exposure.

4.1.8 Testing temperatures should be measured and regulated on the basis of a black panel thermometer unit mounted on the specimen rack so that the face of the unit is in the same relative position and is subjected to the same influences as the test specimens. The black panel thermometer unit should consist of a stainless steel panel about 70 by 50 by 0.95 mm (2.750 by 5.875 by 0.0375 in.), to which a stainless steel bimetallic dial-type thermometer is mechanically fastened. This thermometer should have a stem approximately 4 mm (0.16 in.) in diameter with a 44.5-mm (1.75-in.) dial. The sensitive portion extending about 38 mm (1.5 in.) from the end of the stem should be located in the center of the panel approximately 64 mm (2.5 in.) from the top and approximately 48 mm (1.875 in.) from the bottom

for
used
with

of the panel. The face of the panel with the thermometer stem attached should be finished with a baked-on black infrared-absorbing coating having good resistance to light.

4.1.8.1 A thermocouple or resistance bulb thermometer mounted at the center face of the black panel, which provides temperature values equivalent to the dial thermometer, may be substituted.

for
used
isili-

4.1.9 A blower unit in the base of the apparatus should provide a flow of air through the test chamber and over the test specimens. Control of specimen and black-panel temperature should be accomplished by thermostatic control of the temperature of the constant volume of air from the blower. Black-panel temperatures should be read through the window in the test chamber door without opening the door.

4.1.10 Apparatus operated as a light- and water-exposure test shall be equipped with a specimen spray unit as illustrated in Figs. 2 and 3. All components of the specimen spray unit should be fabricated from stainless steel, plastic, or other material that does not contaminate the water. Apparatus operated only as a light-exposure test are not required to have the specimen spray unit or, if present, it should not be used.

for
used
with

4.1.11 Types A, AH, BH, and some Type B apparatus are equipped with an electrically operated vaporizing unit for adding moisture to the air as it passes through the conditioning chamber in the base section prior to its entry into the test chamber of the apparatus.

4.1.11.1 In Types A and B, the vaporizing unit, when manually turned on, may operate continuously while the apparatus is in operation. Type A and some Type B apparatus may be programmed to operate the vaporizer during a dark cycle only. The temperature of the water, with which the vaporizer is supplied, is not controlled. In Type B apparatus not supplied with a vaporizing unit, the relative humidity within the test chamber is governed by evaporation of water in the bottom of the chamber and from water emitted through the specimen spray unit.

ing
ach
ace
e 4

4.1.11.2 In Types AH and BH apparatus, operation of the vaporizer is controlled automatically by a wet-bulb thermostat. The temperature of the water supplied to the vaporizer is regulated automatically by thermostatically-actuated electric immersion heaters. Control automatically shifts between two separate sets of thermostats as the arc lamp is turned on and off by the program control unit.

4.1.12.2 Any apparatus with a vaporizing unit operated with the unit and immersion heaters turned off will provide essentially the same conditions of relative humidity as are produced in Type B apparatus without a vaporizing unit.

4.1.13 The apparatus shall include means for measuring the following:

- 4.1.13.1 Wattage of the xenon-arc lamp,
- 4.1.13.2 Irradiance at the specimen rack,

- 4.1.13.3 Black-panel temperature,
- 4.1.13.4 Dry-bulb temperature (test chamber),
- 4.1.13.5 Wet-bulb temperature (test chamber),
- 4.1.13.6 Exposure interval, and
- 4.1.13.7 Water spray pressure when applicable.
- 4.1.14 Where specified, the apparatus shall include means for regulating or controlling the following:
 - 4.1.14.1 Wattage of the xenon lamp,
 - 4.1.14.2 Irradiance or irradiation, or both, at the specimen rack,
 - 4.1.14.3 Temperature (test chamber),
 - 4.1.14.4 Relative humidity (test chamber),
 - 4.1.14.5 Light-dark-spray-humidity-temperature cycles, and
 - 4.1.14.6 Water spray pressure when applicable.

4.2 Air-Cooled Type.¹⁰

4.2.1 The apparatus employed shall use an air-cooled xenon-arc lamp as the source of radiation and should be one of the following types, or their equivalent:

4.2.1.1 Type C—Air-cooled xenon-arc apparatus, 1500 W, 158-mm (6.2-in.) diameter specimen rack, with automatic programming of cycles and humidity. The specimen rack should rotate at 5.2 ± 0.1 rpm.

4.2.1.2 Type D—Air-cooled xenon-arc apparatus, 4500 W, 360-mm (14.2-in.) diameter specimen rack, with automatic programming of temperature, cycles, and humidity. The specimen rack should rotate at 3.7 ± 0.1 rpm.

4.2.1.3 Type E—Air-cooled xenon-arc apparatus, three lamps operating simultaneously at 4500 W each, 610-mm (24.1-in.) diameter specimen rack, with automatic programming of temperature, cycles, and humidity. The specimen rack should rotate at 2.0 ± 0.1 rpm.

4.2.2 The xenon arcs employed in Types C and D should be of the medium-pressure, air-cooled type and one or more optical filters shall be fitted between the light source and the samples to filter out undesired wavelengths of radiation. A combination of optical filters recommended by the manufacturer shall be used to simulate (1) sunlight in the open, (2) sunlight behind window glass, or (3) any other simulated solar irradiation condition desired.

4.2.3 All gas discharge lamps have a progressive drop in radiant output with continued use. For Types C and D, it is recommended to exchange the IR-optical filters for new ones after 3500 h of use. Answering the purpose, not all seven IR-optical filters of the filter lantern should be exchanged at the same time but each should be exchanged after it has been running for 3500 h. For Type E which has three lamps, one lamp should be replaced every 500 hours to minimize the overall drop in radiant output. For Type E, the three partial preaged filters should be cleaned monthly and replaced after five years of normal usage.

4.2.4 Specimen holders should rotate around the arc, describing a cylindrical surface, so that specimens may face, or be turned opposite to, the arc. No part of the specimens shall be above or below the ends of the arc. Repositioning of specimens in upper, center, or lower positions can improve the uniformity of intensity of the exposure.

¹⁰ Available from DSET Labs, Box 1850, Black Canyon Stage 1, Phoenix, AZ 85027.

FIG. 2 Specimen Spray Arrangement for Type A and AH Apparatus

4.2.5 Testing temperatures should be measured and regulated on the basis of a black-panel thermometer unit that is mounted so that the face of the unit is in the same relative position and is subjected to the same influences as the test

specimens. The black-panel thermometer unit should consist of a stainless steel panel approximately 48 by 200 by 1 mm (1.9 by 8.0 by 0.04 in.), to which a stainless steel bimetallic dial-type thermometer is mechanically fastened. The temper-

ature at
thermo-
baked-o

tempera
of the te
blower. E
window i
4.2.7

FIG. 3 Specimen Spray Arrangement for Type B and BH Apparatus

ature at the center of the panel should be sensed by the thermometer. The face of the panel should be finished with a baked-on black glossy enamel having good stability to light.

4.2.6 A blower unit in the base of the apparatus shall provide a flow of air through the test chamber and over the test specimens. Control of the specimen and the black-panel temperature should be accomplished by thermostatic control of the temperature of the constant volume of air from the blower. Black-panel temperature should be read through the window in the test chamber door without opening the door.

4.2.7 The apparatus should be equipped with a system to

spray the specimens uniformly with water. This system should be of stainless steel, plastic, or other material that does not react with or contaminate the water employed.

4.2.8 Relative humidity in the test chamber should be measured and controlled by a contact hygrometer. Water should be vaporized and diffused to enrich the air with moisture and produce the required humidity.

4.2.9 The apparatus shall include equipment necessary for measuring and controlling the same parameters as listed for water-cooled xenon arcs.

temper-

5. General Procedure

5.1 Check to be sure the apparatus is operating properly at the start of each test. Check the lamp operation at 100-h intervals to be sure the burner tube and optical filters are clean and that they have not exceeded the maximum recommended period of use.

5.2 Program the instrument to operate in the continuous light-on mode without water spray. Fill the specimen rack with blanks and the black-panel thermometer. Operate the instrument in this mode while regulating the chamber dry-bulb temperature to provide the desired black-panel temperature of $63 \pm 3^\circ\text{C}$ ($145 \pm 5^\circ\text{F}$).

5.3 When the chamber dry-bulb temperature has been regulated, adjust instruments with automatic humidity control to the desired relative humidity (Types C, D, and E) or to the chamber wet-bulb temperature (Types A and B) at the level that will ensure the desired relative humidity.

5.4 In Types A, B, C, D, and E apparatus, use the type and number of spray nozzles (Figs. 2 and 3) recommended by the manufacturer and operate at a pressure of 124 to 172 kPa (18 to 25 psi), measured at the nozzle unless otherwise recommended. The water shall have a pH of 6.0 to 8.0, contain less than 20 ppm solids, and leave no deposit or stain on the specimens after continued exposure in the apparatus. The temperature of the water should be $16 \pm 5^\circ\text{C}$ ($60.8 \pm 9^\circ\text{F}$), and recirculation of the water shall not be permitted unless the recirculated water meets the above requirements. Pass the specimens through the spray once in each minute or revolution of the rack during the spray cycle. Allow the water to strike the test specimens in the form of a fine spray equally distributed over the specimens.

5.5 The temperature of the rack spray water should be sufficiently low to reduce the specimen temperature below the dewpoint when the specimen is continuously sprayed during a dark cycle.

5.6 Reference Standards:

5.6.1 AATCC Blue Wool Lightfastness Standards.³

NOTE 4—The eight standards L-2 to L-9 have been made by blending wool dyed with the fugitive dye Erio Chrome Azurole B and wool dyed with the fast dye Indigosol Blue AGG in different proportions. The blended wools were spun into yarns and the yarns woven into cloths. Each standard is approximately twice as fast as the next lower numbered standard. It has been found that when new lots of the standards are produced, the amounts of the dyes required and the properties of the two wools in the blends are often different from those used originally. The dyeing strengths and blending proportions would therefore be misleading, and they are intentionally not specified.

5.6.2 Any standard sample established by mutual agreement between the purchaser and the supplier.

5.6.3 ISO Gray Scale for Assessing Change in Color.¹¹

5.7 When the material to be evaluated is suspected of being very sensitive to variations in radiant exposure, and the apparatus does not meet the requirement of 4.1.6, it is the responsibility of the concerned parties to mutually agree upon a rearrangement schedule for specimens as part of the

exposure program in order to minimize any effect that variations in irradiance might have as a function of specimen position.

TEST METHOD A—CONTINUOUS EXPOSURE TO LIGHT AND INTERMITTENT EXPOSURE TO WATER SPRAY

6. Procedure

6.1 Apparatus shall be Type A, B, AH, BH, C, D, or E light-exposure device.

6.2 Program the instrument for continuous light and intermittent water spray in accordance with the manufacturer's instructions. Choice of the program selected will be by mutual agreement among the interested parties. Historical convention has established a cycle of 102 min of light followed by a cycle of 18 min of light and water spray as a commonly accepted program that permits the attainment of the maximum black-panel temperature during the light-only portion of the cycle.

6.3 In Types AH and BH apparatus, adjust dry- and wet-bulb temperature controls, humidifier, and immersion heater controls to maintain the desired conditions as specified in Section 5. In Types C, D, and E, adjust the chamber temperature and humidity controls to maintain desired conditions as specified in Section 5.

6.4 In Types A and B with humidifier, humidity may be adjusted but not controlled.

6.4.1 Type B instruments without a humidifier must operate with whatever humidity occurs from the evaporation of water in the bottom of the test chamber and from specimen spray.

TEST METHOD B—ALTERNATE EXPOSURE TO LIGHT AND DARKNESS AND INTERMITTENT EXPOSURE TO WATER SPRAY

7. Procedure

7.1 Apparatus shall be Type A, B, AH, BH, or E light-exposure device.

7.1.1 Types AH, BH, and E apparatus with automatic humidity controls may be operated on alternate light and dark cycles.

7.1.1.1 Operation during the light-on cycle shall be as described in Section 6.

7.1.1.2 Separate controls for temperatures and humidification may be adjusted during the dark cycle for automatic control as the program alternates from light to dark. In Type BH and E apparatus, a rack spray to cool the specimens by wetting the unexposed back surface can result in development of condensation on the exposed specimen surface during the dark cycle.

7.1.2 Types A, B, AH, BH, and E may be programmed to operate on alternate light and dark cycles without control of relative humidity.

TEST METHOD C—CONTINUOUS EXPOSURE TO LIGHT WITHOUT WATER SPRAY

8. Procedure

8.1 Apparatus shall be Types A, B, AH, BH, C, D, or E light-exposure devices programmed for continuous light only, in accordance with the manufacturer's instructions. Optical filters C or D described in 4.1.2.1 should be used.

¹¹ Reference Draft ISO Recommendation No. 177, Document ISO/TC-38 (Secretariat 102) 186. Scales with instructions for use are available from ISO member bodies in the various countries of the world. In the USA they may be obtained from The Secretary, American Association of Textile Chemists and Colorists, P.O. Box 12215, Research Triangle Park, NC 27709.

8.1.1 Adjust the controls on the apparatus so that the black-panel temperature is $63 \pm 3^\circ\text{C}$ ($145 \pm 5^\circ\text{F}$) and the relative humidity is $30 \pm 5\%$ when the xenon lamp is operated at a wattage that provides 20 AATCC Fading Units exposure in about 15 to 25 clock hours. Check at regular intervals and, when necessary, readjust the controls to maintain the specified values for these variables. Target values for black panel temperature, 20 AATCC Fading Units, and relative humidity should be 63°C , 20 clock hours, and 30 %, respectively.

NOTE 5—20 AATCC Fading Units is equivalent to a 1.5 ± 0.2 NLAB(40) unit change in Blue Wool L-4 (#4 on the ISO Gray Scale). Radiation of about 110 kJ/m^2 ($1.5 \text{ W/m}^2 \cdot 20\text{-h}$ exposure) at 420 nm has been found sufficient to produce the specified condition.

8.1.2 Expose the material to be tested as determined by mutual agreement among the concerned parties or, when not otherwise specified, in accordance with one of the following:

8.1.2.1 *Versus One AATCC Blue Wool Lightfastness Standard*—Expose the test specimen and any mutually agreed-upon AATCC Blue Wool Lightfastness Standard until the selected standard between its exposed and unexposed portion exhibits a color change equal to Step 4 of the ISO Gray Scale. Report the results by any mutually agreed-upon method of measuring change in the test specimen.

8.1.2.2 *Versus Set of AATCC Blue Wool Lightfastness Standards*—Expose the test specimen and a set of AATCC Blue Wool Lightfastness Standards until a maximum permissible amount of change, as determined by any specified or mutually agreed-upon method of measurement, occurs in the test specimen. Assign it a classification number equal to that of the numbered standard that most nearly exhibits a change in color equal to Step 4 on the ISO Gray Scale between its exposed and unexposed portion. Where one standard shows a color change greater than Step 4 and the next higher number standard shows less than a Step 4 color change, an intermediate or half-grade rating may be used.

8.1.2.3 *Versus Other Standard Sample*—Expose the test specimen and any mutually agreed-upon standard sample until either, by any specified or mutually agreed-upon method of measurement, shows an agreed-upon amount of change. Report the results on the basis of a comparison of

the specimen with the standard sample.

TEST METHOD D—ALTERNATE EXPOSURE TO LIGHT AND DARKNESS WITHOUT WATER SPRAY

9. Procedure

9.1 Apparatus shall be Types A, B, AH, BH, or E programmed to predetermined cycles of light and darkness by turning off the xenon arc.

NOTE 6—Type B instruments not equipped with a vaporizing unit do not meet the requirements of Test Method D. In Type A and Type B apparatus with intermittent blower operation during the light-off cycle and the atomizer in continuous operation, the test chamber air temperature will drop to that of room air less the heat removed by vaporization of water from wicks and atomizer.

9.1.1 Unless otherwise specified, exposure conditions shall be identical to Test Method B except that during the light-on cycle the equilibrium condition for relative humidity shall be $35 \pm 5\%$ and during periods of darkness equilibrium conditions shall be $90 \pm 5\%$ relative humidity at a dry-bulb temperature of $35 \pm 3^\circ\text{C}$ ($95 \pm 5^\circ\text{F}$).

10. Report

10.1 Report the following information:

10.1.1 Type and model of exposure device,

10.1.2 Type of light source and wattage,

10.1.3 Type and age of filters,

10.1.4 Spectral irradiance at sample location, $\text{W/m}^2 \cdot \text{nm}$ (see Note 9),

10.1.5 Irradiation, kJ/m^2 ,

10.1.6 Elapsed exposure time, h,

10.1.7 Light- or dark-water-humidity program employed,

10.1.8 Operating black-panel temperature,

10.1.9 Operating relative humidity,

10.1.10 Type of spray water,

10.1.11 Type of spray nozzle, and

10.1.12 Specimen relocation procedure.

NOTE 7—When direct measurement of irradiance and spectral irradiance cannot be made, data supplied by the manufacturer shall be substituted. Irradiation in kilojoules per square metre may be calculated by multiplying the product of the irradiance in watts per square metre and the exposure time in hours by the factor 3.6.

FIG. 4 Three-Tiered Specimen Rack

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 1916 Race St., Philadelphia, PA 19103.

Standard Test Method for Cathodic Disbonding of Pipeline Coatings Subjected to Elevated Temperatures¹

This standard is issued under the fixed designation G 42; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

Scope

1.1 This test method describes an accelerated procedure for determining comparative characteristics of insulating coating systems applied to steel pipe exterior for the purpose of preventing or mitigating corrosion that may occur in underground service where the pipe will be exposed to high temperatures and is under cathodic protection. This test method is intended for use with samples of coated pipe taken from commercial production and is applicable to such samples when the coating is characterized by function as an electrical barrier.

1.2 This test method is intended for testing coatings submerged or immersed in the test solution at elevated temperature. When it is impractical to submerge or immerse the test specimen, Test Method G 95 may be considered where the test cell is cemented to the surface of the coated pipe specimen. If room temperatures are required, see Test Method G 8. If a specific test method is required with no options, see Test Method G 80.

1.3 The values stated in SI units to three significant decimals are to be regarded as the standard.

1.4 *This standard does not purport to address the safety problems associated with its use. It is the responsibility of the user of this standard to consult and establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

2. Referenced Document

2.1 ASTM Standards:

G 8 Test Methods for Cathodic Disbonding of Pipeline Coatings²

G 12 Test Method for Nondestructive Measurement of Film Thickness of Pipeline Coatings on Steel²

G 80 Test Method for Specific Cathodic Disbonding of Pipeline Coatings³

G 95 Test Method for Cathodic Disbondment Test of Pipeline Coatings (Attached Cell Method)³

3. Summary of Test Method

3.1 This test method subjects the coating on the test specimen to electrical stress in a highly conductive electrolyte. The coating is artificially perforated before starting the

test. The electrical stress is produced by connecting the test specimen to the negative terminal of a source of direct current and by connecting an anode to the positive terminal. Electrical instrumentation is provided for measuring the current flowing in the cell. The electrical potential is also measured and the specimen is physically examined at intervals during the test period and upon conclusion of the test.

3.1.1 The cathodic stress is applied under conditions of a constant-elevated temperature.

4. Significance and Use

4.1 Damage to pipe coating is almost unavoidable during transportation and construction. Breaks or holidays in pipe coatings may expose the pipe to possible corrosion since, after a pipe has been installed underground, the surrounding earth will be moisture-bearing and will constitute an effective electrolyte. Applied cathodic protection potentials may cause loosening of the coating, beginning at holiday edges. Spontaneous holidays may also be caused by such potentials. This test method provides accelerated conditions for cathodic disbondment to occur and provides a measure of resistance of coatings to this type of action.

4.2 The effects of the test are to be evaluated by physical examinations and monitoring the current drawn by the test specimen. Usually there is no correlation between the two methods of evaluation, but both methods are significant. Physical examination consists of assessing the effective contact of the coating with the metal surface in terms of observed differences in the relative adhesive bond. It is usually found that the cathodically disbonded area propagates from an area where adhesion is zero to an area where adhesion reaches the original level. An intermediate zone of decreased adhesion may also be present.

4.3 Assumptions associated with test results include:

4.3.1 Maximum adhesion, or bond, is found in the coating that was not immersed in the test liquid, and

4.3.2 Decreased adhesion in the immersed test area is the result of cathodic disbondment.

4.4 Ability to resist disbondment is a desired quality on a comparative basis, but disbondment in this test method is not necessarily an adverse indication of coating performance. The virtue of this test method is that all dielectric-type coatings now in common use will disbond to some degree, thus providing a means of comparing one coating to another.

4.5 The current density appearing in this test method is much greater than that usually required for cathodic protection in natural environments.

4.6 That any relatively lesser bonded area was caused by electrical stressing in combination with the elevated and or

¹ This method is under the jurisdiction of ASTM Committee G-3 on Durability of Nonmetallic Materials and is the direct responsibility of Subcommittee G03.06 on Durability of Pipeline Coatings and Linings.

Current edition approved May 25, 1990. Published July 1990. Originally published as G 42-75T. Last previous edition G 42-85.

² Annual Book of ASTM Standards, Vols 06.01 and 14.02.

³ Annual Book of ASTM Standards, Vol 14.02.

depressed temperature and was not attributable to an anomaly in the application process. Ability to resist disbondment is a desired quality on a comparative basis, but most insulating materials will disbond to some extent under the accelerated conditions of this test. Bond strength is more important for proper functioning of some coatings than others and the same measured disbondment for two different coating systems may not represent equivalent loss of corrosion protection.

4.6.1 The amount of current flowing in the test cell is a relative indicator of the extent of areas requiring protection against corrosion; however, the current density appearing in this test is much greater than that usually required for cathodic protection in natural, inland soil environments.

4.6.2 Test voltages higher than those recommended may result in the formation of chlorine gas. The subsequent chemical effects on the coating could cast doubt on the interpretation of the test results.

5. Apparatus

5.1 *Test Vessel*—A suitable nonreactive vessel shall be used, capable of withstanding internal heating at not less than 60°C and suitable for continuous circulation of the electrolyte. A 19-L (5-gal) cylindrical glass vessel has been found suitable, having an approximate diameter of 300 mm (12 in.) and a depth of 300 mm. A flat bottom is required for operation of a magnetic stirring rod. Dimensions of the vessel shall permit the following requirements:

5.1.1 Test specimens shall be suspended vertically in the vessel with at least 25 mm (1 in.) clearance from the bottom.

5.1.2 Test specimens shall be separated by not less than 38 mm (1½ in.), and a vertically suspended anode can be placed at an equal distance from each specimen not less than the separation distance.

5.1.3 Test specimens shall be separated from any wall of the vessel by not less than 13 mm (½ in.).

5.1.4 Depth of electrolyte shall permit the test length of the specimen to be immersed as required in 7.4.

5.1.5 The reference electrode may be placed anywhere in the vessel, provided it is separated from the specimen and from the anode by not less than 38 mm (1½ in.).

5.2 *Anode*—The anode shall be provided with a factory-sealed, insulated copper wire lead.⁴

5.3 *Connectors*—Wiring from anode to test specimen shall be 4107 cmil (14-gage Awg), minimum, insulated copper. Attachment to the test specimen shall be by soldering or brazing to the nonimmersed end, and the place of attachment shall be coated with an insulating material. A junction in the connecting wire is permitted, provided that it is made by means of a bolted pair of terminal lugs soldered or mechanically crimped to clean wire ends.

5.4 *Holiday Tools*—Holidays shall be made with conventional drills of the required diameter. For use in preparing small-diameter pipe specimens such as 19-mm (¾-in.) nominal diameter pipe, the use of a drill modified by substantially grinding away the sharp cone point has been found effective in preventing perforation of the metal wall of the pipe. A

sharp-pointed knife with a safe handle is required for use in making physical examinations.

5.5 Multimeters:

5.5.1 *Multimeter*, for direct current, having an internal resistance of not less than 10 MΩ and having a range from 0.01 to 5 V for measuring potential to the reference electrode.

5.5.2 *Multimeter*, for direct current, having an internal resistance of not less than 11 MΩ and capable of measuring as low as 10 μV potential drop across a shunt in the test cell circuit.

5.5.3 *Multimeter*, for initial testing of apparent coating resistance.

5.6 *Reference Electrode*—Saturated Cu/CuSO₄ electrode having a potential of -0.316 V with respect to the standard hydrogen electrode shall be the standard of reference in these test methods. Other electrodes may be used but measurements thus obtained shall be converted to the Cu/CuSO₄ reference for reporting by making the proper correction.

NOTE 1—A saturated Cu/CuSO₄ electrode reading -1.50 V at 25°C will read -1.53 V at 60°C, a scale increase of 0.03 V.

5.6.1 A saturated calomel electrode at 25°C is converted to Cu/CuSO₄ by adding -0.07 V to the observed reading. If the saturated calomel electrode reads -1.43 V at 25°C, it will read -1.46 V at 60°C, a scale increase of 0.03 V. It follows that a saturated calomel electrode reading of -1.46 V at 60°C is equal to a saturated Cu/CuSO₄ reading of -1.50 V at 25°C.

5.6.2 A 0.1 normal calomel electrode at 25°C is converted to Cu/CuSO₄ by subtracting -0.02 V from the observed reading. Since the potential change due to an increase from 25°C to 60°C is negligible, it follows that a 0.1 normal calomel electrode reading -1.52 V at 60°C is equal to a saturated Cu/CuSO₄ reading of -1.50 V at 25°C.

5.7 *Thermometers*, two, mercury-filled type, accurate to ±1°C. One shall be of the full-immersion type for measuring temperature near the bottom of the vessel, and a second thermometer shall be of the partial-immersion type for measuring temperature near the top of the vessel.

5.8 *Combination Heater Plate*, with built-in magnetic stirrer, or equivalent, shall be used for heating and stirring the electrolyte. The heater shall be adjustable to produce and control a temperature of 60 ± 1°C in the test vessel.

5.9 *Direct-Current Rectifier*, capable of supplying constant current at a voltage of 1.50 ± 0.01 V, as measured between the specimen and reference cell.

5.10 *Thickness Gage*, for measuring coating thickness in accordance with Test Method G 12.

5.11 *Precision Resistor*, 1Ω ± 1%, 1 W (min), to be used in the test cell circuit as a shunt for current.

5.12 *Carbon or Stainless Steel Electrode*, used temporarily with the volt-ohm-meter to determine apparent initial holiday status of the test specimen.

5.13 *Additional Connecting Wires*, 4107 cmil (14-gage Awg), minimum, insulated copper.

5.14 *Brass Snids*, used at a terminal board, together with alligator clips or knife switches, for making and breaking circuits. Alligator clips shall not be used to connect the electrodes or specimens at the top location of test cells.

6. Reagents and Materials

6.1 The electrolyte shall consist of potable tap water or

⁴ Duriron, a material found suitable for this purpose is available from Duriron Co., Inc., Dayton, OH.

higher purity water (distilled or demineralized water is satisfactory) with the addition of 1 weight % of each of the following technical-grade salts, calculated on an anhydrous basis: sodium chloride, sodium sulfate, and sodium carbonate.

NOTE 2—The resulting solution has a pH of 10 or higher and a resistivity of 25 to 50 $\Omega \cdot \text{cm}$ at room temperature.

6.2 Materials for sealing the ends of coated pipe specimens may consist of bituminous products, wax, epoxy, or other materials, including molded elastomeric or plastic end caps, capable of withstanding the test temperature.

6.3 Plywood has been found suitable for the construction of nonconductive test vessel covers and for the support through apertures of test specimens and electrodes. Wood dowels introduced through holes in the top ends of test specimens have been found suitable for suspending test specimens from the vessel cover.

7. Test Specimen

7.1 The test specimen shall be a representative piece of production-coated pipe. One end shall be plugged, sealed, or capped.

7.2 One holiday shall be made in the middle of the immersed length by drilling a radial hole through the coating so that the angular cone point of the drill will fully enter the steel where the cylindrical portion of the drill meets the steel surface. The drill diameter shall be not less than three times the coating thickness, but it shall never be less than 6 mm ($\frac{1}{4}$ in.) in diameter. The steel wall of the pipe shall not be perforated. With small-diameter pipes, where there is danger of perforating the pipe, the holiday shall be started with a standard 60° cone point and finished with a drill that has had a substantial portion of the cone point ground away.

NOTE 3—Before making the holiday, see 7.5.

7.3 The end of the pipe which will protrude above the

immersion line shall be provided with suitable supporting means and a separate wire connection for electrical purposes, soldered, or brazed to the pipe. The protruding end, including hanger and wire connections, shall be protected and sealed with an insulating coating material.

7.4 The specimen test area shall consist of the area between the edge of the bottom end seal and the immersion line. The bottom end seal area shall not be considered part of the area tested. Coated specimens of any suitable diameter and length of pipe may be used, but the immersed area shall be not less than 23 200 mm^2 (36 in.^2). An area of 92 900 mm^2 (1 ft^2) has been found preferable when convenient.

7.5 The continuity of the coating and efficiency of the end seal shall be tested before making artificial holidays as follows:

7.5.1 Immerse the test specimen and a carbon or stainless steel electrode in the electrolyte. Connect one terminal of the ohmmeter to the test specimen and the other terminal to the carbon or stainless steel electrode. Measure the apparent resistance in ohms, making two determinations: one with the specimen connected to the positive terminal of the ohmmeter, and one with the specimen connected to the negative terminal. The lowest of the two readings should be not less than 1000 $\text{M}\Omega$, however, the test may be conducted with a low reading less than 1000 $\text{M}\Omega$, provided that the condition is taken into account in evaluating results.

8. Procedure

8.1 Immerse the test specimen in the electrolyte and connect it to the anode as shown in Fig. 1. Adjust the rectifier or voltage divider so that the potential between specimen and reference cell is -1.50 ± 0.01 V at 25°C (-1.53 ± 0.01 V at 60°C) (see Fig. 2). Position the holiday to face toward the anode. Space the anode with respect to test specimens as required in 5.1. Mark the correct immersion level on the exterior of the test vessel and maintain by daily

NOTE—For multiple specimens in the same test vessel, see Fig. 2, for circuit diagram using voltage dividers.

FIG. 1 Test Set-Up for Cathodic Disbonding Test at Elevated Temperature

FIG. 2 Circuit Diagram for Cathodic Disbonding Test

additions of preheated, distilled, or demineralized water as required.

8.2 The temperature of the electrolyte surface to bottom shall be not less than $60 \pm 3^\circ\text{C}$. The electrolyte shall be continuously circulated by means of the stirring apparatus or equivalent. The maximum temperature shall be attained 4 ± 1 h after starting the heater and immersing the specimen.

NOTE 4—Throughout the test period, ejected sealant or salt deposits, or both, may form near, or partially obstruct the intentional coating holiday described in 7.2. No attempt shall be made to clear the holiday while the test is in progress.

8.3. Electrical Monitoring Schedule:

8.3.1 Electrical measurements shall be made on the start-up day and on each normal working day thereafter for the duration of the test. A maximum of three consecutive nonworking days shall be preceded by at least two working days; one non-working day or two consecutive non-working days shall be preceded by at least one working day, except at start-up and termination when three and two working days are required, respectively.

8.3.2 Electrical measurements characterizing the start of the test are defined as the average of measurements taken on the second and third days after immersion.

8.3.3 Electrical measurements characterizing intermediate and terminal time spans shall be taken on two successive days prior to and including the target date.

8.4 Electrical measurements and adjustments made each normal working day:

8.4.1 Measure E_2 , the stress potential in volts between the test specimen and the reference electrode, without disconnecting the energized anode or specimen from the circuit.

Use the high-resistance voltmeter described in 5.5. The stress potential, E_2 , should measure -1.50 ± 0.01 V at 25°C (-1.53 ± 0.01 V at 60°C); if it does not, adjust the rectifier or voltage divider accordingly.

8.4.2 After E_2 has been measured and adjusted, if necessary, measure I_1 , the current demand in amperes, by determining the potential drop across the 1- Ω precision resistor permanently installed in the test cell circuit with the high-resistance voltmeter described in 5.2. The voltage reading will be numerically equal to amperes.

NOTE 5—An alternative method of measuring current demand utilizes a zero-resistance ammeter. In this method, the wire connection between the test specimen and anode is temporarily broken and a zero-resistance ammeter temporarily interposed between the specimen and the anode. Reconnect the specimen to the anode with the connector wire as soon as this measurement is completed.

8.4.3 Measure E_1 , the polarized potential, in volts, using the high-resistance voltmeter described in 5.5 connected between the test specimen and the reference electrode as follows:

8.4.3.1 Disconnect the anode from the test specimen while closely observing the high-resistance voltmeter. As the instrument pointer falls, it will dwell significantly at the polarized potential before recording further. The dwell point is E_1 .

8.5 Standard duration of the test period shall be 30 days (720 h) in the energized test vessel including warm-up and cool-down times, unless longer test periods are specified.

8.6 A physical examination shall be performed immediately upon termination of the test period as follows:

8.6.1 Before examination, wash the test specimen care-

under gently flowing tap water without disturbing destructive effects. Adjust the temperature of the tap water so that it approximates that of the room temperature.

7.2 Examine the entire immersed area visually for any evidence of new holidays and loosening of coating at the cut end, including the artificial holiday.

7.3 Drill a new test hole in the coating in an area that is not immersed, staying away from the immersion line and the cut end. Recommended distances are given in Fig. 3. Use the same drilling procedure described in 7.2.

7.4 In order to gage or calibrate the lifting technique, attempt to lift the coating at the new test hole with the point of a sharp knife after making cuts through the coating meeting at the center of the hole. Inability or relative resistance to lifting or disbonding the coating shall be considered the adhered or bonded condition of the untested coating with respect to the lifting technique used.

7.5 Determine if the coating has been loosened at the immersed test hole by attempting to lift the coating with the point of a sharp knife after making cuts through the coating

intersecting at the holiday or point of inspection using the same technique applied in 8.6.4. Classify coating that can be lifted or disbonded more readily than at the new test hole as unsealed area. Measure the unsealed area.

NOTE 6—The use of a transparent film having a grid laid out in small squares such as 2.54 mm (0.1 in.) on a side has been found useful. The film is placed against the unsealed area and the boundary of the unsealed area is traced on the grid. The area is then obtained by counting the squares within the bounded area.

8.7 Determine and record the resistivity and pH of the electrolyte at the beginning and end of the test period.

9. Report

9.1. The report shall include the following (see Fig. 4):

9.1.1 Complete identification of the test specimen, including:

9.1.1.1 Name and code number of the coating,

9.1.1.2 Size of pipe,

DIMENSION	MILLIMETRES	INCHES
A	490.22 ± 12.7	(19.300 ± 0.500)
B	245.11 ± 12.7	(9.650 ± 0.500)
C	114.3 ± 6.35	(4.500 ± 0.250)
D	233.363 MIN	(9.1875, min)
E	19.05 MIN	(0.750, min)

FIG. 4 Suggested Form for Use in Presenting Data

9.1.1.3 Source, production date, and production run number,

9.1.1.4 Minimum-maximum coating thickness.

9.1.1.5 Immersed area,

9.1.1.6 Size and number of initial holidays, and

9.1.1.7 Dates of starting and terminating test.

9.1.2 The relative resistances of the test specimen, in ohms, before the artificial holiday was made as described in 7.5.

9.1.3 Tally of areas that have been found unsealed on the terminal date. Areas may be reported in square millimetres (or square inches) or millimetres (or inches) of equivalent circle diameter of the area, or both.

9.1.4 The results of starting, intermediate, and terminal electrical measurements. Report the following measurements:

9.1.4.1 Current demand in microamperes or negative characteristic of the logarithm of the current in amperes, in both,

9.1.4.2 The value of $\Delta E = E_2 - E_1$, in volts, and

9.1.4.3 Change from start to termination for values in 9.1.4.1 and 9.1.4.2.

9.1.5 Temperature of the electrolyte at approximately the same hour each working day.

9.1.6 Other information that may be pertinent.

10. Precision and Bias

10.1 Precision data are limited to two adjacent specimens taken from the same production-coated pipe and assumed that the production process was uniform with respect to pipe

surface condition and coating material. Specimens that were not adjacent in the as-produced condition or were taken from different lengths of pipe may represent differing process conditions. The following data should be used for judging the acceptability of results. (These precision data are approximations based on limited data, but they provide a reasonable basis for judging the significance of results.)

10.2 *Repeatability*—Duplicate results obtained within a laboratory should be acceptable unless they differ by more than 25 mm (1 in.) in value D in accordance with the following equation:

$$D = (A/0.785)^{1/2}$$

where:

A = unsealed area developed from one artificial holiday, mm² (or in.²)

or if they differ by more than unity in the negative characteristic of the logarithm of the current demand in amperes.

10.3 *Reproducibility*—The results reported by one laboratory should be acceptable unless they differ from those of another laboratory by more than 25 mm (1 in.) for the value D in the equation given in 10.2, and by more than unity in the negative characteristic of the logarithm of the current demand in amperes.

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 1916 Race St., Philadelphia, PA 19103.

Standard Practice for Operating Light- and Water-Exposure Apparatus (Fluorescent UV-Condensation Type) for Exposure of Nonmetallic Materials¹

This standard is issued under the fixed designation G 53; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense. Consult the DoD Index of Specifications and Standards for the specific year of issue which has been adopted by the Department of Defense.

1. Scope

1.1 This practice covers the basic principles and operating procedures for using fluorescent ultraviolet (UV) and condensation apparatus to simulate the deterioration caused by sunlight and water as rain or dew.

1.2 This practice is limited to the method of obtaining, measuring, and controlling the conditions and procedures of exposure. It does not specify the exposure conditions best suited for the material to be tested. Specimen preparation and evaluation of the results are covered in ASTM test methods or specifications for specific materials.

1.3 The values stated in SI units are to be regarded as the standard.

1.4 *This standard may involve hazardous materials, operations, and equipment. This standard does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

2. Referenced Documents

2.1 ASTM Standards:

E 220 Method for Calibration of Thermocouples by Comparison Techniques²

G 7 Practice for Atmospheric Environmental Exposure Testing of Nonmetallic Materials³

2.2 CIE Standard:

No. 20 Recommendations for the Integrated Irradiance and the Spectral Distribution of Simulated Solar Radiation for Testing Purposes⁴

3. Description of Terms Specific to This Standard

3.1 *irradiance*—the radiation incident on a surface expressed in W/m^2 . Irradiance is the total of the incident radiation at all wavelengths. Forty watt fluorescent lamps of the UV-B and UV-A types generate similar amounts of

irradiance. However, since this irradiance is distributed at different wavelengths, the photochemical effects caused by these different lamps vary greatly. Therefore, irradiance should not be used to compare UV light sources.

3.2 *spectral irradiance*—distribution of irradiance as a function of wavelength. It is expressed in W/m^2 per wavelength band. The spectral irradiance of sunlight is often shown as W/m^2 per 10 nm band. The spectral irradiance of fluorescent UV lamps should be shown in bands 1 or 2 nm wide. Spectral irradiance is the proper method for comparing sources with different energy distributions.

3.3 *spectral energy distribution (SED)*—general term for the characterization of the amount of radiation present at each wavelength. SEDs can be expressed by power in watts, irradiance in W/m^2 , or energy in joules. The shape of the SED would be identical in all of these units. Fluorescent lamps are frequently described by relative SEDs which show the amount of radiation at each wavelength as a percentage of the amount of radiation at the peak wavelength. Fig. 1 is a relative SED.

3.4 *ultraviolet regions*—CIE Publication No. 20 (1972) divides the ultraviolet spectrum into three regions: UV-A, radiation in wavelengths between 315 nm and 400 nm; UV-B, radiation in wavelengths between 280 nm and 315 nm; and UV-C, radiation in wavelengths shorter than 280 nm.

3.5 *fluorescent UV lamp*—lamp in which radiation at 254 nm from a low-pressure mercury arc is transformed to longer wavelength UV by a phosphor. The spectral energy distribution of a fluorescent UV lamp is determined by the emission

FIG. 1 Typical Relative SED of UV-B Lamp

¹ This practice is under the jurisdiction of ASTM Committee G-3 on Durability of Nonmetallic Materials, and is the direct responsibility of Subcommittee G03.03 on Simulated and Controlled Environmental Tests.

spectrum of the phosphor and the UV transmission of the glass tube.

Summary of Practice

4.1 Specimens are alternately exposed to ultraviolet light alone and to condensation alone in a repetitive cycle.

4.2 The UV source is an array of fluorescent lamps, with lamp emission concentrated in the UV range.

4.3 Condensation is produced by exposing the test surface to a heated, saturated mixture of air and water vapor, while the reverse side of the test specimen is exposed to the cooling influence of ambient room air.

4.4 The exposure condition may be varied by selection of the fluorescent UV lamp; the timing of the UV and condensation exposure; the temperature of UV exposure; and the temperature of condensation exposure.

5. Significance and Use

5.1 The use of the apparatus under this practice is intended to simulate the deterioration caused by water as rain or dew and the ultraviolet energy in sunlight. It is not intended to simulate the deterioration caused by localized weather phenomena, such as atmospheric pollution, biological attack, and salt water exposure.

5.2 Variation in results may be expected when operating conditions are varied within the accepted limits of this practice. Therefore, no reference shall be made to results from use of this practice unless accompanied by a report detailing the specific operating conditions in conformance with Section 11.

5.3 Any report correlating results from use of this practice to results from a period of natural weathering shall specify in detail the conditions of natural exposure, since sunlight and water effects upon materials exposed to the weather will vary from year to year and also vary with location, latitude, time of year, temperature, proximity to water sources, etc.

NOTE 1—Practice G 7 lists the information required to describe a particular condition of outdoor exposure.

5.4 Correlations established and reported in conformance with 5.2 and 5.3 shall not be extrapolated to other test conditions permitted by this practice, to other conditions of natural exposure, or to materials other than those tested.

6. Apparatus⁵

6.1 *Test Chamber*, (see Fig. 2) constructed of corrosion-resistant materials enclosing eight fluorescent UV lamps, a heated water pan, test specimen racks, and provisions for controlling and indicating operating times and temperatures.

6.2 *Lamps*, rapid start, medium bipin fluorescent UV lamps with a length of 1220 mm, and a nominal rating of 40 W when operated from a ballast providing a controlled current of 430 mA at 102V.

6.2.1 Unless otherwise specified, the lamps shall be UV-B lamps with a peak emission at 313 nm and a spectral energy distribution as shown in Fig. 1.

⁵ Apparatus and lamps from Q-Panel Co., 26200 First St., Cleveland, OH 44145, and from Atlas Electric Devices Co., 4114 N. Ravenswood Ave., Chicago, IL 60613, have been found satisfactory.

FIG. 2 Apparatus Schematic Cross Section

6.2.2 Other fluorescent UV lamps meeting the size and electrical characteristics in 6.2 may be used, provided that the lamp and spectral energy distribution are reported in conformance with Section 11.

6.3 *Lamp Spacing and Arrangement*—The lamps shall be mounted in two banks of four lamps each as shown in Fig. 2. The lamps in each bank shall be mounted parallel in a flat plane on 70-mm centers.

6.4 *Specimen Mounting and Arrangement*—The test specimens shall be mounted in stationary racks with the plane of the test surface parallel to the plane of the lamps at a distance of 50 mm from the nearest surface of the lamps, as shown in Fig. 2.

6.4.1 The test specimens shall be exposed within an area 210 mm in height by 900 mm wide on each side of the apparatus located as shown in Fig. 4.

NOTE 2—It is possible to mount specimens above, below, and beside the 210 by 900 mm area, but specimens so mounted will be exposed to lower UV intensities.

6.5 *Condensation Mechanism*—Water vapor shall be generated by heating a water pan extending under the entire sample area and containing a minimum water depth of 25 mm. Specimen racks and the test specimens themselves shall constitute the side walls of the chamber. The back side of the

LAMP ROTATION

FIG. 3 Lamp Rotation

FIG. 4 Limits of Area of Uniform Intensity

specimens shall be exposed to cooling effects of ambient room air. The resulting heat transfer causes water to condense on the test surface.

6.5.1 The specimens shall be arranged so that condensate runs off the test surface by gravity and is replaced by fresh condensate in a continuous process. Vents along the bottom of the test chamber shall be provided to permit an exchange of ambient air and water vapor to prevent oxygen depletion of the condensate.

6.6 *Water Supply*, with an automatic control to regulate the level in the water pan shall be provided. Distilled, deionized, or potable tap water are equally acceptable for purposes of the test, since the condensation process itself distills water onto the test surface.

6.7 *Cycle Timer*, a continuously operating cycle time, for programming the selected cycle of UV periods and condensation periods.

6.7.1 Hour meters shall be provided to record total time of operation and total time of UV exposure.

6.8 *Specimen Temperature Measurement:*

6.8.1 Specimen temperature shall be measured by a thermometer with a remote sensor attached to a black aluminum panel 75 by 100 by 2.5 mm thick. The thermometer shall be precise to $\pm 1^\circ\text{C}$ through a range from 30° to 80°C . The indicator dial shall be located outside the test chamber.

6.8.2 The black aluminum panel with the thermometer sensor shall be positioned in the center of the exposure area so that the sensor is subject to the same conditions as the specimens.

6.9 *Specimen Temperature Control:*

6.9.1 During UV exposure, the selected equilibrium temperature shall be maintained within $\pm 3^\circ\text{C}$ by supplying heated air to the test chamber.

6.9.2 During condensation exposure, the selected equilibrium temperature shall be maintained within $\pm 3^\circ\text{C}$ by heating the water in the water pan.

6.9.3 The UV and condensation temperature controls shall be independent of each other.

6.9.4 Doors shall be located on the room air side of the specimen racks to act as insulation during the UV exposure and to minimize drafts. Such doors shall not interfere with the room air cooling of the specimen during the condensation exposure.

6.10 *Test Chamber Location:*

6.10.1 The apparatus shall be located in an area maintained at a temperature between 20°C and 30°C . The room temperature shall be measured by thermometers mounted on interior walls or column approximately 1500 mm above the floor level and at least 300 mm from any heated apparatus. Three or more thermometers located at various points will show any temperature variation in the area.

6.10.2 It is recommended that the apparatus be located at least 300 mm from walls or other apparatus. Nearby heat

sources, such as ovens or heated test apparatus, should be avoided or shielded, because such heat sources can reduce the cooling required for condensation.

6.10.3 The room where the apparatus is located shall be ventilated to remove the heat and moisture produced and to maintain the temperatures specified in 6.10.1. Two to four air changes per hour will normally provide sufficient ventilation.

7. Test Specimens

7.1 Replicate specimens are desirable to provide a record of degradation at different time intervals. Retention of an unexposed specimen is recommended as it is difficult to mask a specimen to prevent exposure to condensation.

7.2 For specimens of insulating materials, such as wood, plastic, or porous laminates, maximum specimen thickness should be 20 mm to allow adequate heat transfer for condensation.

7.3 To provide rigidity, flexible specimens may be attached to a backing panel made of aluminum or other noncorrosive heat conductive material.

7.4 Cut edges of coated steel specimens shall be protected so that rust does not contaminate the test surface.

7.5 Holes in specimens and any openings larger than 1 mm around irregularly shaped specimens shall be sealed to prevent loss of water vapor. Porous specimens, such as textiles or wood shall be backed with a vapor barrier such as metal or plastic.

8. Calibration and Standardization

8.1 The thermometer or thermocouple which indicates test temperature shall be calibrated by immersing the sensing element and a liquid-in-glass thermometer in water heated to approximately 70°C and comparing the two temperatures as in Method E 220.

8.2 The formation of condensation may be observed by using clear glass or plastic blanks in the specimen holders or rack. One large sheet of plastic may also be used for this purpose. The condensate that forms on a given area during a period of condensation may be collected and then measured.

8.3 The fading and other changes caused by the fluorescent UV lamps may be observed by exposing lightfastness standards in the apparatus using UV alone without condensation.

8.3.1 The AATCC Blue Wool Lightfastness reference materials⁶ may be used to measure the changes caused by UV. The L2 Blue Wool has been found satisfactory for evaluating fluorescent UV lamps.

8.3.2 Other lightfastness reference materials may be used by agreement.

8.4 Reference standards for calibrating the operation of the apparatus in alternate exposure to UV light and condensation may be prepared from painted metal, plastics, or other materials. Painted metal specimens produced by the coil-coating process have been found suitable for such reference standards.

9. Procedure

9.1 Mount the test specimens in the specimen racks with

⁶ Available from American Association of Textile Chemists and Colorists, P.O. Box 12215, Research Triangle Park, NC 27709.

the test surfaces facing the lamp. When the test specimens do not completely fill the racks, fill the empty spaces with blank panels to maintain the test conditions within the chamber.

9.2 Program the selected test conditions. Operate continuously, repeating the cycle, except for servicing the instrument and inspection of specimens.

9.3 Various test conditions may be used. If no conditions are specified, the following cycle and temperatures are suggested: 4 h UV at 60°C, 4 h Condensation at 50°C.

NOTE 3—Prior versions of this practice recommended a condensation temperature of 40°C in 9.3. When operating in room conditions that do not comply with those set forth in 6.10, a 40°C condensation temperature can result in inadequate condensation. Therefore, a 50°C condensation temperature is now suggested.

9.3.1 Any test temperature that can be maintained within the limits specified in 6.9.1 and 6.9.2 may be used. UV test temperatures of 50°C, 60°C, and 70°C are widely used. A condensation test temperature of 50°C is commonly used.

9.3.2 The following time cycles are widely used: 4 h UV/4 h CON, and 8 h UV/4 hr CON. Use UV and condensation periods of at least 2-h duration to allow sufficient time to reach equilibrium.

9.3.3 The severity of the UV exposure is influenced by test temperatures and time cycles. Photochemical reaction begins as soon as the UV lamps are turned on. The rate of UV degradation is proportional to the time of UV exposure or the temperature of UV exposure, or both. UV exposures at temperatures higher than those expected in the service environment can cause abnormal thermal degradation.

9.3.4 Water reactions during condensation exposure are affected by the permeability of the specimen and require time to initiate. The rate of water degradation is increased by increased temperature. However, long hot condensation exposures can cause abnormal degradation. Four-hour condensation exposures are often used for paints on metals, while condensation exposures of 20 h duration may be used on wood.

9.4 Maintenance—Periodic maintenance is required to maintain uniform UV and condensation exposure conditions.

9.4.1 After 400 to 450 h of lamp operating time, replace one lamp in each bank of lamps, and rotate the other lamps as shown in Fig. 3. This procedure provides a useful lamp life of 1600 to 1800 h.

9.4.2 Drain water and clean water pan when conducting lamp replacement and rotation procedure. Scum on the top of the water can inhibit water vaporization.

9.5 Sample Rotation—The samples' positions within the test area should be rotated on a regular basis in order to minimize any effects from horizontal or vertical variations in UV or temperature. The sample rotation sequence should provide that all samples spend approximately the same amount of exposure time near the center of the exposure area and near the edges of the exposure area. The following rotation sequence is recommended:

9.5.1 Horizontal Rotation—Once a day rotate the extreme left hand and extreme right hand samples into the center as shown in Fig. 6.

9.5.2 Vertical Rotation—Rotate the samples vertically so that each sample spends the same amount of exposure time in each vertical position in the sample holder. For instance, if two samples are stacked vertically in each sample holder, then the top and bottom sample should switch places halfway through the test method. If four samples are stacked vertically, then the samples should be repositioned vertically three times during the test method.

9.5.3 Other sample rotation sequences may be used by agreement.

9.6 Inspect specimens daily in tests with a length of 1 week or less. Tests for longer periods should be inspected weekly.

9.6.1 A permanent record of degradation at various times may be obtained by using three replicate specimens and

removing the replicates sequentially at intervals equal to one third of the test length.

9.7 Conclude the test when either a mutually agreed-upon number of total test hours or a mutually agreed-upon change has occurred in the test specimen or a standard test specimen. For convenience in inspecting and concluding tests during normal working hours, the following test durations are recommended:

96 h = 4 days	672 h = 4 weeks
168 h = 1 week	1008 h = 6 weeks
336 h = 2 weeks	1512 h = 9 weeks
504 h = 3 weeks	2016 h = 12 weeks

10. Interpretation of Results

10.1 This practice is intended to simulate the deterioration caused by natural weathering. However, the rate of degradation in natural weathering varies from year to year. Laboratory accelerated weathering is more consistent in rate. Therefore, in comparing natural and laboratory weathering one should not attempt to predict the number of hours of laboratory exposure that might equal a year of natural weathering. Even if the details of the natural exposure are fully reported as required by 5.3, any time to time comparison would apply only to a given year at a particular site.

10.2 It is possible to correlate the deterioration resulting from a period of natural weathering, such as 1 year, to the deterioration resulting from a period of laboratory accelerated weathering. Spearman rank correlation, which is dis-

cussed in most basic statistical texts, has proved to be a useful method for this. A minimum of seven variables must be ranked by both test methods to obtain statistical validity from Spearman rank correlation. Ranking 10 to 15 variables by both methods will improve the reliability of such correlations.

10.3 It is frequently not possible to predict how many hours or weeks of accelerated testing will yield the best correlation to some period of outdoor testing. Therefore, laboratory tests should be measured periodically, such as weekly or biweekly, so that the correlation coefficient may be calculated at several points during the accelerated test.

11. Report

11.1 The report shall include the following:

11.1.1 Manufacturer and model of fluorescent UV/condensation apparatus,

11.1.2 Manufacturer's designation for the fluorescent UV lamp, the wavelength (nm) at which peak emission occurs, and the short wavelength at which 1 % of peak emission occurs (for example, FS-40 313/280 nm),

11.1.3 Cycle of UV exposure time and temperature, condensation time and temperature (for example 4 h UV/60°C, 4 h CON/50°C),

11.1.4 Total exposure time,

11.1.5 Special conditions of test, such as rotation of test specimens, and

11.2 A sample report form is shown in Fig. 5.

§D 912-81 (1986)	Cuprous Oxide, Antifouling
D 911-87	Mercuric Oxide, Antifouling
D 520-84 (1989)	Zinc Dust

Blue Pigments

D 963-81 (1986) ^{e2}	Copper Phthalocyanine Blue
D 261-75 (1987) ^{e1}	Iron Blue
D 262-81 (1987) ^{e1}	Ultramarine Blue

Green Pigments

§D 212-87	Chrome Green
D 263-75 (1987)	Chrome Oxide Green
D 3021-82 (1987) ^{e1}	Phthalocyanine Green

Yellow, Orange, Brown Pigments

D 1649-82 (1987) ^{e1}	Chromate, Strontium
D 478-86 (1991) ^{e1}	Chromate, Zinc Yellow
D 211-67 (1989) ^{e1}	Chrome Yellow and Chrome Orange
§D 768-81 (1987) ^{e1}	Iron Oxide, Hydrated Yellow

§ Approved for use by agencies of the Department of Defense and, if indicated on the standard, replaces corresponding Federal or Military document. Consult the DoD Index of Specifications and Standards for the specific year of issue which has been adopted by the Department of Defense.

LIST BY SUBJECTS, VOLUME 06.02

D 3722 - 82 (1991) [†]	Iron Oxide, Natural Red and Brown
D 3724 - 82 (1987) [†]	Iron Oxide, Synthetic Brown
§D 2218 - 67 (1989) [†]	Molybdate Orange
D 85 - 87 (1991) [†]	Ochre
D 765 - 87 (1991) [†]	Sienna, Raw and Burnt
D 1648 - 86	Silicochromate, Basic Lead
D 763 - 81 (1988) [†]	Umber, Raw and Burnt

Red Pigments

D 3722 - 82 (1987) [†]	Iron Oxides, Natural Red and Brown
D 3721 - 83 (1991) [†]	Iron Oxide, Synthetic Red
D 475 - 67 (1989)	Para, Pure Red Toner
D 83 - 84 (1989)	Red Lead
§D 656 - 87	Toluidine, Pure Red Toner

PIGMENT TEST METHODS

Analytical Tests

Test Methods for:

D 305 - 84 (1990) [†]	Acetone Extract in Black Pigments, Determination of
§D 480 - 88	Aluminum Powders and Pastes, Flaked, Sampling and Testing
D 718 - 86 (1991) [†]	Aluminum Silicate Pigment, Analysis of
§D 2350 - 90	Antimony Oxide in White Pigment Separated from Solvent-Reducible Paints, Determination of
D 715 - 86 (1991) [†]	Barium Sulfate Pigment, Analysis of
§D 1135 - 86 (1991) [†]	Blue Pigments, Chemical Analysis of
D 4487 - 90	Calcium Borosilicate, Analysis of
§D 126 - 87 (1991) [†]	Chromium, Yellow, Orange, and Green Pigments, Analysis of
§D 185 - 84 (1989) [†]	Coarse Particles in Pigments, Pastes, and Paints
§D 1208 - 84 (1989) [†]	Common Properties of Certain Pigments
§D 283 - 84 (1990) [†]	Copper and Dry Cuprous Oxide Pigments, Chemical Analysis of
D 3872 - 86 (1991) [†]	Ferrous Iron in Iron Oxides, Determination of
§D 280 - 81 (1987)	Hygroscopic Moisture (and Other Volatile Matter) in Pigments
D 4358 - 84 (1990) [†]	Lead and Chromium in Air Particulate Filter Samples of Lead Chromate Pigment Dusts
§D 717 - 86 (1991) [†]	Magnesium Silicate Pigment, Analysis of
D 284 - 88	Mercuric Oxide Pigment, Chemical Analysis of
D 716 - 86 (1991) [†]	Mica Pigment, Evaluating
D 3256 - 86 (1991) [†]	Phthalocyanine Blue and Green Pigments, Chemical Analysis of
D 49 - 83 (1990) [†]	Red Lead, Chemical Analysis of
§D 970 - 86 (1991) [†]	Red Pigments, Para and Toluidine
D 719 - 86	Silica, Diatomaceous Pigment, Analysis of
D 1844 - 86 (1991) [†]	Silicochromate, Basic Lead, Chemical Analysis of
D 1845 - 86 (1991) [†]	Strontium Chromate Pigment, Chemical Analysis of
D 2351 - 90	Sulfide Sulfur in White Pigment Separated from Solvent-Reducible Paints, Determination of
D 2352 - 85 (1990) [†]	Sulfur Dioxide in White Pigment Separated from Solvent-Reducible Paints, Determination of
D 3720 - 84	Titanium Dioxide Pigments, Ratio of Anatase to Rutile by X-Ray Diffraction
D 3926 - 80 (1991) [†]	Titanium Dioxide Slurries, Percent Solids in
D 2742 - 79	Tribasic Lead Phosphosilicate, Chemical Analysis of (Discontinued (1990)†)
D 2448 - 85 (1989)	Water-Soluble Salts in Pigments by Measuring the Specific Resistance of the Leachate of the Pigment
§D 1301 - 91	White Lead Pigments, Chemical Analysis of
§D 1394 - 76 (1991) [†]	White Titanium Pigments, Chemical Analysis of
§D 3280 - 85 (1990) [†]	White Zinc Pigments, Chemical Analysis of
§D 50 - 90	Yellow, Orange, Red, and Brown Pigments, Chemical Analysis of
D 521 - 81	Zinc Dust, Chemical Analysis of
D 4450 - 85 (1990) [†]	Zinc Hydroxy Phosphite, Analysis of
§D 444 - 88	Zinc Yellow (Zinc Chromate), Chemical Analysis of

Practice for:

§D 34 - 91	White Pigments, Chemical Analysis of
------------	--------------------------------------

Guide for:

D 4139 - 82 (1991) [†]	Volatile and Nonvolatile Content of Pigments, Determining
---------------------------------	---

General Physical Tests

Test Methods for:

D 1155 - 89	Glass Spheres, Roundness
D 1214 - 89	Glass Spheres, Sieve Analysis
D 1483 - 84 (1989) [†]	Oil Absorption of Pigments by Gardner-Coleman Method

† Although this standard has been officially withdrawn from Society approval, a brief description is included for information only.

LIST BY SUBJECTS, VOLUME 06.02

Test Methods for:

§D 281 - 84 (1989)
D 3360 - 80 (1989)
§D 153 - 84 (1989)⁶¹

Oil Absorption of Pigments by Spatula Rub-Out
Particle Size Distribution of Common White Extender Pigments
Specific Gravity of Pigments

Practice for:

D 1366 - 86 (1991)⁶¹

Particle Size Characteristics of Pigments, Reporting

Color and Opacity Tests

Test Methods for:

§D 279 - 87 (1991)⁶¹
D 3022 - 84 (1989)⁶¹
§D 387 - 86
D 2745 - 89
§D 332 - 87 (1991)⁶¹

Bleeding of Pigments
Color and Strength of Color Pigments by Use of a Miniature Sandmill
Color and Strength of Color Pigments with a Mechanical Muller
Tinting Strength of White Pigments, Relative, by Reflectance Measurements
Tinting Strength of White Pigments, Relative, by Visual Observation

RESINS AND POLYMERS

Specifications for:

§D 207 - 55 (1987)
D 784 - 83 (1987)
D 237 - 91
D 360 - 89

Lac, Dry Bleached
Orange Shellac and Other Indian Lacs for Electrical Insulation
Orange Shellac and Other Lacs
Shellac Varnishes

General

Guide for:

D 4277 - 83 (1988)⁶¹
D 4142 - 89
D 4143 - 89
D 4368 - 89

Amino Resins, Testing
Epoxy Resins, Testing
Latex Vehicles, Testing
Poly(Vinyl Chloride) Resins, Testing

Test Methods for:

D 1979 - 91
§D 29 - 81 (1987)⁶¹
D 365 - 84 (1989)⁶¹
D 411 - 83 (1987)
D 1650 - 91
D 1439 - 83a (1989)⁶¹
D 509 - 70 (1987)

Amino Resins, Free Formaldehyde Content
Lac Resins, Sampling and Testing
Nitrocellulose Base Solutions, Soluble
Shellac for Electrical Insulation, Testing
Shellac Varnish, Sampling and Testing
Sodium Carboxymethylcellulose
Rosin, Sampling and Grading (see Vol 06.03)

Practice for:

D 2689 - 88

Alkyd Resins, Testing

Resin Chemical Tests

Test Methods for:

D 1926 - 89
D 2455 - 89
D 1726 - 90
D 1847 - 87
§D 1652 - 90
§D 1398 - 84
D 1615 - 60 (1987)
§D 2572 - 91
D 2690 - 89
§D 1013 - 88
D 4613 - 86 (1990)⁶¹
D 1312 - 56 (1987)⁶¹
D 4706 - 87
§D 563 - 88
§D 1306 - 88
D 1396 - 73 (1987)⁶¹
D 3680 - 89
D 1469 - 73 (1988)⁶¹
§D 1542 - 60 (1988)⁶¹
D 3733 - 78 (1984)⁶¹
§D 1397 - 88
D 465 - 82 (1987)⁶¹
D 1063 - 51 (1987)
D 1585 - 82

Carboxyl Content of Cellulose
Carboxylic Acids in Alkyd Resins
Chlorine Content, Hydrolyzable, in Epoxy Resins
Chlorine Content, Total, in Epoxy Resins
Epoxy Content of Epoxy Resins
Fatty Acids in Alkyds
Glycerol, Glycol, and Pentaerythritol in Alkyds
Isocyanate Groups in Urethane Materials or Prepolymers
Isophthalic Acid in Alkyd and Polyester Resins
Nitrogen, Total, in Resins and Plastics
pH, Apparent of Water-Insoluble Phenol-Formaldehyde Resins
Phenol, Free, in Phenolic Resins
Phenolic Resins, Determining Methylol Group Qualitatively in
Phthalic Anhydride Content of Alkyd Resins and Resin Solutions
Phthalic Anhydride in Alkyds and Esters Containing Other Dibasic Acids (Gravimetric)
Poly(Vinyl Butyral), Chemical Analysis of
Vinyl Chloride Monomer, Residual Content of Poly(Vinyl Chloride) Resins, Compounds, and Copolymers by Solution Injection Technique
Rosin Acids Content of Coating Vehicles, Total
Rosin in Varnishes, Qualitative Detection
Silicon Content of Silicone Polymers and Silicone-Modified Alkyds by Atomic Absorption
Unsaponifiable Matter in Alkyds, Vinyl Chloride
Acid Number of Rosin (see Vol 06.03)
Ash in Rosin (see Vol 06.03)
Fatty Acids in Tall Oil Rosin (see Vol 06.03)

LIST BY SUBJECTS, VOLUME 06.02

Test Methods for:

§D 1064 - 58 (1981)
D 464 - 91
D 1065 - 82

Iron in Rosin (see Vol 06.03)
Saponification Number of Rosin (see Vol 06.03)
Unsaponifiable Matter in Rosin (see Vol 06.03)

Color Tests

Test Methods for:

D 2090 - 88
§D 1544 - 80 (1989)⁶¹

Clarity and Cleanness of Paint and Ink Liquids
Color of Transparent Liquids (Gardner Color Scale)

Resin Physical Tests

Test Methods for:

D 5097 - 90
D 4758 - 87
§D 1259 - 85 (1990)⁶¹
D 4613 - 86
D 4640 - 86 (1990)⁶¹
D 4639 - 86 (1990)⁶¹
D 2998 - 89
D 2456 - 91
§D 3432 - 89
D 4827 - 88
D 4747 - 87
D 3008 - 90
§E 28 - 67 (1982)⁶¹
D 889 - 58 (1987)

Filter-Retained Solids Content of Polymer Latexes
Nonvolatile Content of Latexes
Nonvolatile Content of Resin Solutions
pH, Apparent, of Water-Insoluble Phenol-Formaldehyde Resins
Phenol-Formaldehyde Resins, Determining Stroke Cure Time of Thermosetting
Phenolic Resins Volatile Content
Polyhydric Alcohols in Alkyd Resins, Determination of
Polyhydric Alcohols in Alkyd Resins, Identification of
Toluene Diisocyanates, Unreacted, in Thermosetting Urethane Prepolymers and Coating Solutions Using Gas-Liquid Chromatography
Unreacted Monomer Content of Latexes Using Capillary Column Gas Chromatography
Unreacted Monomer Content of Latexes Using Gas-Liquid Chromatography
Resin Acids in Rosin by Gas Chromatography (see Vol 06.03)
Softening Point by Ring- and Ball-Apparatus (see Vol 06.03)
Volatile Oil in Rosin (see Vol 06.03)

Practice for:

D 4209 - 82 (1991)⁶¹

Volatile and Nonvolatile Content of Cellulosics, Emulsions, Resin Solutions, Shellac, and Varnishes

Solubility and Miscibility Tests

Test Methods for:

D 3132 - 84 (1990)⁶¹
D 1198 - 88
D 269 - 52 (1987)⁶¹

Solubility Range of Resins and Polymers
Solvent Tolerance of Amine Resins
Toluene-Insoluble Solid Matter in Rosin (Chiefly Sand, Chips, Dirt, and Bark) (see Vol 06.03)

Definitions

Definitions of Terms Relating to:

D 804 - 79 (1987)

Naval Stores and Related Products (see Vol 06.03)

CELLULOSE AND CELLULOSE DERIVATIVES

Test Methods for:

D 1794 - 89
D 3516 - 89
D 1926 - 89
D 817 - 91
D 871 - 91
D 1716 - 62 (1987)
D 301 - 89
D 2641 - 89
D 1915 - 63 (1989)⁶¹
D 3971 - 89
D 4794 - 88
§D 914 - 72 (1989)⁶¹
D 2364 - 89
D 2363 - 79 (1989)⁶¹
D 1795 - 90
D 4085 - 81 (1987)
D 3876 - 79 (1989)⁶¹
D 1347 - 72 (1989)⁶¹
D 1348 - 89
D 4795 - 88
D 1787 - 89
D 2438 - 89
§D 1439 - 83a (1989)⁶¹
D 1696 - 90
D 2929 - 89
§D 1343 - 91

Alcohol-Benzene Soluble Matter in Cellulose (Intent to Withdraw)
Ashing Cellulose
Carboxyl Content of Cellulose
Cellulose Acetate Propionate and Cellulose Acetate Butyrate, Testing
Cellulose Acetate, Testing
Cellulose Chain Length Uniformity by Fractional Precipitation of Cellulose Nitrate
Cellulose Nitrate, Soluble
Chlorine in Cellulose
Chromatographic Analysis of Chemically Refined Cellulose
Dichloromethane-Soluble Matter in Cellulose
Ethoxyl Substitution in Cellulose Ether Products by Gas Chromatography, Determination of
Ethylcellulose
Hydroxyethylcellulose
Hydroxypropyl Methylcellulose
Intrinsic Viscosity of Cellulose
Metals in Cellulose by Atomic Absorption Spectrophotometry
Methoxyl and Hydroxypropyl Substitution in Cellulose Ether Products by Gas Chromatography
Methylcellulose
Moisture in Cellulose
Nitrogen Content of Soluble Nitrocellulose—Alternative Method
Pentosans in Cellulose
Silica in Cellulose
Sodium Carboxymethylcellulose
Solubility of Cellulose in Sodium Hydroxide
Sulfur Content of Cellulosic Materials by X-ray Fluorescence
Viscosity of Cellulose Derivatives by Ball-Drop Method

LIST BY SUBJECTS, VOLUME 06.02

Terminology of:

D 1695 - 77 (1989)⁶¹

Cellulose and Cellulose Derivatives

POLYMERS

Test Methods for:

D 3536 - 76 (1988)⁶¹

Molecular Weight Averages and Molecular Weight Distribution by Liquid Exclusion Chromatography (Gel Permeation Chromatography—GPC) (see Vol 08.03)

D 3593 - 80 (1986)⁶¹

Molecular Weight Averages and Molecular Weight Distribution of Certain Polymers by Liquid Size-Exclusion Chromatography (Gel Permeation Chromatography—GPC) Using Universal Calibration (see Vol 08.03)

Practices for:

D 3750 - 79 (1985)

Number-Average Molecular Weight of Polymers by Membrane Osmometry, Determination of (see Vol 08.03)

D 2857 - 87

Viscosity of Polymers, Dilute Solution (see Vol 08.02)

D 4001 - 81 (1986)⁶¹

Weight-Average Molecular Weight of Polymers by Light Scattering, Determination of (see Vol 08.03)

GENERAL STANDARDS

Specifications for:

E 100 - 81 (1986)

ASTM Hydrometers (see Vol 14.03)

E 1 - 90

ASTM Thermometers (see Vol 14.03)

E 133 - 86

Distillation Equipment (see Vol 14.02)

E 11 - 87

Wire-Cloth Sieves for Testing Purposes (see Vols 04.01, 04.02, 04.06, 05.05, and 14.02)

Test Methods for:

E 70 - 90

pH of Aqueous Solutions with the Glass Electrode (see Vol 15.05)

Practices for:

D 5166 - 91

Gelled Vehicle Samples, Laboratory Preparation Using a Microwave Oven

E 300 - 86

Industrial Chemicals, Sampling (see Vol 06.03)

E 20 - 85

Particle-Size Distribution of Particulate Substances of Subsieve Sizes, Analysis by Microscopical Methods for (see Vol 14.02)

E 180 - 90

Precision of ASTM Methods for Analysis and Testing of Industrial Chemicals, Developing (see Vol 15.05)

E 200 - 86

Standard Solutions for Chemical Analysis, Preparation, Standardization, and Storage of (see Vol 15.05)

Definitions of Terms Relating to:

E 12 - 70 (1986)

Density and Specific Gravity of Solids, Liquids, and Gases (see Vols 04.02 and 15.05)

METRIC PRACTICE

Practice for:

§E 380 - 91

Use of the International System of Units (SI) (the Modernized Metric System) (Excerpts) (see Related Material section)

List by Subjects

1992 ANNUAL BOOK OF ASTM STANDARDS, VOLUME 06.03

PAINT—FATTY OILS AND ACIDS, NAVAL STORES, SOLVENTS, MISCELLANEOUS; AROMATIC HYDROCARBONS

Since the standards in this book are arranged in alphanumerical sequence, no page numbers are given in this list. The standards listed in *italics* are related documents included for information only and do not appear in this volume.

For List by Subjects of Volumes 06.01 and 06.02, see pp. xxiv and 1095
A complete Subject Index begins on p. 1133

FATTY OILS AND ACIDS, DRYING AND NONDRYING

Specifications for:

D 1539 - 60 (1988)	Castor Acids, Dehydrated
D 961 - 86	Castor Oil, Dehydrated
D 960 - 79 (1988)	Castor Oil, Raw
D 1841 - 63 (1988) ^{ei}	Coconut Fatty Acids, Distilled
D 1842 - 63 (1988)	Corn Fatty Acids, Distilled
D 1843 - 63 (1988) ^{ei}	Cottonseed Fatty Acids, Fractionated and Distilled
D 1538 - 60 (1988) ^{ei}	Linseed Fatty Acids, Distilled
D 260 - 86 (1990)	Linseed Oil, Boiled
D 234 - 82 (1991) ^{ei}	Linseed Oil, Raw
D 601 - 87 (1991) ^{ei}	Oiticica Oil (Permanently Liquid)
D 1392 - 87	Safflower Oil
D 1537 - 60 (1988) ^{ei}	Soybean Fatty Acids, Distilled
D 124 - 88	Soybean Oil, Degummed
D 1462 - 87	Soybean Oil, Refined
D 3169 - 89	Sunflower Oil
D 1984 - 69 (1988)	Tall Oil Fatty Acids
D 12 - 88	Tung Oil, Raw

Test Methods for:

D 1950 - 86	Acetone Tolerance of Heat-Bodied Drying Oils
D 1980 - 87 (1991)	Acid Value of Fatty Acids
<i>§D</i> 1951 - 86	Ash in Drying Oils and Fatty Acids
<i>§D</i> 1952 - 86	Break in Drying Oils, Quantitative Determination of
D 2090 - 88	Clarity and Cleanness of Paint and Ink Liquids
<i>§D</i> 1967 - 86	Color After Heating of Drying Oils (Heat Bleach), Measuring
D 1981 - 86 (1990)	Color After Heating of Fatty Acids, Measuring
<i>§D</i> 1544 - 80 (1989) ^{ei}	Color of Transparent Liquids (Gardner Color Scale)
D 1358 - 86	Diene Value, Spectrophotometric, of Dehydrated Castor Oil and Its Derivatives
<i>§D</i> 1983 - 90	Fatty Acid Composition by Gas-Liquid Chromatography of Methyl Esters
D 3457 - 87 (1991) ^{ei}	Fatty Acid Composition by Gas-Liquid Chromatography, Preparation of Methyl Esters from Fatty Acids for Determination of
<i>§D</i> 2800 - 87	Fatty Acid Composition by Gas-Liquid Chromatography, Preparation of Methyl Esters from Oils for Determination of
<i>§D</i> 3725 - 78 (1988) ^{ei}	Fish Oil in Drying Oils and Drying Oil Fatty Acids by Gas-Liquid Chromatography, Semiquantitative Determination of
<i>§D</i> 93 - 90	Flash Point by Pensky-Martens Closed Tester
<i>§D</i> 3278 - 89	Flash Point of Liquids by Setaflash Closed-Cup Apparatus
D 1966 - 69 (1991) ^{ei}	Foots in Raw Linseed Oil (Gravimetric Method)
<i>§D</i> 1954 - 86	Foots in Raw Linseed Oil (Volumetric Method)
<i>§D</i> 1955 - 85 (1989) ^{ei}	Gel Time of Drying Oils
D 1957 - 86	Hydroxyl Value of Fatty Oils and Acids
<i>§D</i> 2245 - 90	Identification of Oils and Oil Acids in Solvent-Reducible Paints
<i>§D</i> 1959 - 85 (1989) ^{ei}	Iodine Value of Drying Oils and Fatty Acids
D 1541 - 86	Iodine Value, Total, of Drying Oils and Their Derivatives

§ Approved for use by agencies of the Department of Defense, and if indicated on the standard, replaces corresponding Federal or Military document. Consult the DoD Index of Specifications and Standards for the specific year of issue which has been adopted by the Department of Defense.

LIST BY SUBJECTS, VOLUME 06.03

Test Methods for:

- §D 1960 - 86 (1990) Loss on Heating of Drying Oils
- D 1958 - 86 (1990) Oiticica Oil, Chloroform Insoluble Matter in
- D 2575 - 70 (1987) Polymerized Fatty Acids
- D 1240 - 82 Rosin Acids in Fatty Acids
- D 1466 - 86 Sampling Liquid Oils and Fatty Acids Commonly Used in Paints, Varnishes, and Related Materials
- §D 1962 - 85 (1989)[†] Saponification Value of Drying Oils and Fatty Acids
- D 1963 - 85 (1989)[†] Specific Gravity of Drying Oils, Varnishes, Resins, and Related Materials
- D 803 - 82 (1987) Tall Oil
- D 1585 - 82 Tall Oil Rosin, Fatty Acids Content of
- D 1982 - 85 (1989)[†] Titer of Fatty Acids
- §D 1964 - 85 (1989)[†] Tung Oil Quality
- §D 1965 - 87 (1991)[†] Unsaponifiable Matter in Drying Oils and Fatty Acids
- §D 1545 - 89 Viscosity of Transparent Liquids by Bubble Time Method

Guides for:

- §D 555 - 84 (1988)[†] Drying Oils, Testing
- D 1467 - 89 Fatty Acids Used in Protective Coatings, Testing,
- D 4140 - 82 (1991)[†] Volatile and Nonvolatile Content of Driers, Drying Oils, Naval Stores, and Solvents, Determining

FATTY NITROGEN PRODUCTS

Test Methods for:

- D 2076 - 64 (1987)[†] Acid Value and Amine Value of Fatty Quaternary Ammonium Chlorides
- D 2074 - 66 (1987)[†] Amine Values, Total, Primary, Secondary, and Tertiary, of Fatty Amines by Alternative Indicator Method
- D 2073 - 66 (1987)[†] Amine Values, Total, Primary, Secondary, and Tertiary, of Fatty Amines, Amidoamines, and Diamines by Referee Potentiometric Method
- D 2077 - 64 (1987) Ash in Fatty Quaternary Ammonium Chlorides
- D 2071 - 87 (1991) Fatty Nitrogen Products
- D 2075 - 89 Iodine Value of Fatty Amines, Amidoamines, and Diamines
- D 2078 - 86 (1990) Iodine Value of Fatty Quaternary Ammonium Chlorides
- D 2080 - 64 (1987) Molecular Weight, Average, of Fatty Quaternary Ammonium Chlorides
- D 2082 - 82 (1987) Non-amines, Percent in Fatty Nitrogen Compounds
- D 2079 - 82 (1987) Nonvolatile Matter (Solids) in Fatty Quaternary Ammonium Chlorides
- D 2081 - 64 (1987) pH of Fatty Quaternary Ammonium Chlorides
- D 2083 - 66 (1987) Primary, Secondary, and Tertiary Amines, Percent in Fatty Amines
- D 2072 - 66 (1987)[†] Water in Fatty Nitrogen Compounds

SOLVENT SPECIFICATIONS

Petroleum Spirits

- §D 235 - 87[†] Petroleum Spirits (Mineral Spirits)
- D 3735 - 87 VM&P Naphthas

Terpene Solvents

- §D 13 - 82 (1987) Turpentine, Spirits of

Aromatic Hydrocarbons and Related Materials

- D 836 - 84 Benzene, Industrial Grade (Discontinued 1991)
- D 835 - 85 Benzene-485, Refined (Nitration Grade)
- D 2359 - 85a Benzene-535, Refined
- D 3055 - 86 Cyclohexane 995
- D 3734 - 91 High-Flash Aromatic Naphthas
- D 4077 - 81 (1986)[†] Isopropylbenzene (Cumene)
- D 2827 - 88[†] Styrene Monomer 996
- §D 362 - 84 Toluene, Industrial Grade (Discontinued 1991)
- D 841 - 85 Toluene, Nitration Grade
- D 4076 - 86 o-Xylene 950
- D 843 - 80 (1985)[†] Xylene, Nitration Grade
- D 846 - 84 Xylene, Ten-Degree (Discontinued 1991)

Alcohols and Ether Alcohols

- D 319 - 90 Amyl Alcohol (Synthetic)
- D 330 - 89 2-Butoxyethanol
- §D 304 - 90 n-Butyl Alcohol (1-Butanol)
- D 1007 - 85 sec-Butyl Alcohol (2-Butanol)
- D 2694 - 87 Diethylene Glycol
- D 2696 - 87 Dipropylene Glycol (Discontinued 1992†—Replaced by Specification D 5164)
- D 4836 - 90 Dipropylene Glycol Monomethyl Ether
- D 331 - 90 2-Ethoxyethanol

LIST BY SUBJECTS, VOLUME 06.03

D 2693 - 87	Ethylene Glycol
D 2636 - 91	Hexylene Glycol
§D 1719 - 90	Isobutyl Alcohol (Isobutanol)
D 770 - 90	Isopropyl Alcohol (Isopropanol)
D 3160 - 91	Isopropylbenzene (Cumene), Phenol Content
D 3128 - 89	2-Methoxyethanol
D 1152 - 89	Methanol (Methyl Alcohol)
D 2635 - 91	Methyl Isobutyl Carbinol
D 3622 - 90	n-Propyl Alcohol (1-Propanol)
D 2695 - 87	Propylene Glycol (Discontinued 1992†—Replaced by Specification D 5164)
D 4837 - 89	Propylene Glycol Monomethyl Ether

Ketones

§D 329 - 90	Acetone
D 2627 - 91	Diacetone Alcohol
D 2916 - 88	Isophorone
D 4360 - 90	Methyl n-Amyl Ketone
D 740 - 89	Methyl Ethyl Ketone
D 3729 - 84	Methyl Ethyl Ketone (99.5 % Grade) (Discontinued 1989†—Replaced by Specification D 740)
§D 2917 - 91	Methyl Isoamyl Ketone
§D 1153 - 90	Methyl Isobutyl Ketone

Esters

D 3540 - 86	Amyl Acetate, Primary, Synthetic (98 % Grade)
D 4615 - 86 ^{e1}	n-Butyl Acetate (All Grades)
D 3728 - 88	2-Ethoxyethyl Acetate (99 % Grade)
D 4614 - 86	Ethyl Acetate (All Grades)
D 5137 - 90	Hexyl Acetate
§D 1718 - 86	Isobutyl Acetate (95 % Grade)
D 3131 - 88	Isopropyl Acetate (98 % Grade)
D 2634 - 86	Methyl Amyl Acetate
D 3130 - 86	n-Propyl Acetate (96 % Grade)
D 4835 - 89	Propylene Glycol Monomethyl Ether Acetate

SOLVENT TEST METHODS

General Methods

Test Methods for:

D 801 - 57 (1987)	Dipentene, Sampling and Testing
§D 233 - 65 (1981) ^{e1}	Turpentine, Sampling and Testing
D 268 - 90	Volatile Solvents for Use in Paint and Related Coatings and Materials, Sampling and Testing

Chemical Tests

Test Methods for:

D 1612 - 90	Acetone in Methanol (Methyl Alcohol)
§D 1613 - 91	Acidity in Volatile Solvents and Chemical Intermediates Used in Paint, Varnish, Lacquer, and Related Products
§D 847 - 87	Acidity of Benzene, Toluene, Xylenes, Solvent Naphthas, and Similar Industrial Aromatic Hydrocarbons
§D 1614 - 91	Alkalinity in Acetone
D 1492 - 87	Bromine Index of Aromatic Hydrocarbons by Coulometric Titration
D 2324 - 81 (1989) ^{e1}	Carbon Disulfide in Benzene
D 848 - 81 (1989) ^{e1}	Color, Acid Wash, of Industrial Aromatic Hydrocarbons
D 849 - 88	Copper Corrosion by Industrial Aromatic Hydrocarbons
§D 130 - 88	Copper Corrosion from Petroleum Products
§D 1617 - 90	Ester Value of Lacquer Solvents and Thinners
§D 853 - 82 (1987) ^{e1}	Hydrogen Sulfide and Sulfur Dioxide Content (Qualitative) of Industrial Aromatic Hydrocarbons
§D 1363 - 88	Permanganate Time of Acetone and Methanol
D 3961 - 89	Sulfur, Trace Quantities in Liquid Aromatic Hydrocarbons by Oxidative Microcoulometry
D 1685 - 86	Thiophene in Benzene, Traces of, Using Isatin and Spectrophotometry
D 890 - 58 (1987)	Water in Liquid Naval Stores
§D 1364 - 90	Water in Volatile Solvents (Fischer Reagent Titration Method)
E 203 - 75 (1986) ^{e1}	Water Using Karl Fischer Reagent (see Vol 15.05)

Physical Tests

Test Methods for:

§D 3545 - 90	Acetate Esters, Alcohol Content and Purity by Gas Chromatography
--------------	--

† Although this standard has been officially withdrawn from Society approval, a brief description is included for information only.

LIST BY SUBJECTS, VOLUME 06.03

Test Methods for:

§D 3257 - 88	Aromatics in Mineral Spirits by Gas Chromatography
D 2935 - 81 (1985)	Apparent Density of Industrial Aromatic Hydrocarbons
D 4367 - 89	Benzene in Hydrocarbon Solvents by Gas Chromatography
§D 1209 - 84 (1988) ⁶¹	Color of Clear Liquids (Platinum-Cobalt Scale)
D 3054 - 81 (1985)	Cyclohexane, Purity and Benzene Content by Gas Chromatography
§D 850 - 86	Distillation of Aromatic Hydrocarbons
§D 86 - 90	Distillation of Petroleum Products
§D 1078 - 86	Distillation Range of Volatile Organic Liquids
D 5008 - 89	2-Ethylhexonal, Ethyl Methyl Pentanol Content and Purity Value by Gas Chromatography
§D 3539 - 87	Evaporation Rates of Volatile Liquids (see Vol 06.01)
D 3934 - 90	Flash/No-Flash—Equilibrium Method by a Closed-Cup Apparatus
§D 1310 - 86 (1990) ⁶¹	Flash Point and Fire Points of Liquids by Tag Open-Cup Apparatus
§D 93 - 90	Flash Point by Pensky-Martens Closed Tester
§D 56 - 87	Flash Point by Tag Closed Tester
D 3941 - 90	Flash Point of Liquids by Equilibrium Method With Closed-Cup Apparatus
§D 3278 - 82 ⁶¹	Flash Point of Liquids by Setaflash Closed-Cup Apparatus
D 3893 - 90	Methyl Amyl Ketone and Methyl Isoamyl Ketone Purity by Gas Chromatography
§D 2804 - 88	Methyl Ethyl Ketone Purity Using Gas Chromatography
§D 3329 - 89	Methyl Isobutyl Ketone Purity by Gas Chromatography
D 2360 - 82 (1987) ⁶¹	Monocyclic Aromatic Hydrocarbons, Trace Impurities in, by Gas Chromatography
§D 1353 - 90	Nonvolatile Matter in Volatile Solvents for Use in Paint, Varnish, Lacquer, and Related Products
§D 1296 - 84 (1988) ⁶¹	Odor, Residual, of Volatile Solvents and Diluents
D 4773 - 89	Purity of Propylene Glycol Monomethyl Ether, Dipropylene Glycol Monomethyl Ether, and Propylene Glycol Monomethyl Ether Acetate
D 852 - 87	Solidification Point of Benzene
D 1493 - 84 (1988)	Solidification Point of Industrial Organic Chemicals
D 4206 - 89	Sustained Burning of Liquid Mixtures by Setaflash Apparatus (Open Cup)
D 4207 - 91	Sustained Burning of Low-Viscosity Liquid Mixtures by Wick Test
D 3962 - 80 (1989) ⁶¹	Styrene Analysis by Gas Chromatography
D 3009 - 72 (1981) ⁶¹	Turpentine Composition by Gas Chromatography
D 1555 - 83	Volume and Weight of Industrial Aromatic Hydrocarbons, Calculation of
§D 95 - 83 (1990)	Water in Petroleum Products and Bituminous Materials by Distillation
D 2306 - 81 (1985)	Xylene Isomer Analysis by Gas Chromatography
D 3797 - 88	<i>o</i> -Xylene Analysis by Gas Chromatography
D 3798 - 89	<i>p</i> -Xylene Analysis by Gas Chromatography
D 1217 - 86	Density and Relative Density (Specific Gravity) of Liquids by Bingham Pycnometer (see Vol 05.01)
D 1015 - 84	Freezing Points of High-Purity Hydrocarbons
D 1016 - 84	Purity of Hydrocarbons from Freezing Points
D 1218 - 87	Refractive Index and Refractive Dispersion of Hydrocarbon Liquids (see Vol 05.01)

Solubility and Miscibility Tests

Test Methods for:

D 611 - 82 (1987) ⁶¹	Aniline Point and Mixed Aniline Point of Petroleum Products and Hydrocarbon Solvents
§D 1720 - 88	Dilution Ratio of Active Solvents in Cellulose Nitrate Solutions
§D 1476 - 88	Heptane Miscibility of Lacquer Solvents
§D 1133 - 90	Kauri-Butanol Value of Hydrocarbon Solvents
§D 1722 - 90	Water Miscibility of Water-Soluble Solvents

Liquid Naval Stores

Test Methods for:

D 801 - 57 (1987)	Dipentene, Sampling and Testing
§D 86 - 82 ⁶²	Distillation of Petroleum Products
§D 56 - 87	Flash Point by Tag Closed Tester
D 802 - 82 (1987)	Pine Oil, Sampling and Testing
D 856 - 49 (1987)	Pine Tars and Pine-Tar Oils
D 1131 - 53 (1981) ⁶¹	Rosin Oils
D 803 - 82 (1987)	Tall Oil
§D 233 - 65 (1981) ⁶¹	Turpentine, Sampling and Testing
D 3009 - 72 (1981) ⁶¹	Turpentine Composition by Gas Chromatography
D 890 - 58 (1987)	Water in Liquid Naval Stores

MISCELLANEOUS RAW MATERIALS

Specifications for:

D 4710 - 87	Acetaldehyde
D 3620 - 90	Acetic Acid, Glacial
D 4416 - 89	Acrylic Acid
D 3547 - 91	<i>n</i> -Butyl Acrylate
D 608 - 90	Dibutyl Phthalate
D 3548 - 86	Ethyl Acrylate
D 3193 - 91	Ethylbenzene
D 3541 - 91	2-Ethylhexyl Acrylate
D 1969 - 91	2-Ethylhexyl (Synthetic)
D 2378 - 84 (1987)	Formaldehyde
D 1257 - 90	Glycerin, High-Gravity
D 3504 - 91	Maleic Anhydride
D 3845 - 89	Methacrylic Acid, Glacial
D 4709 - 87	Methyl Acrylate
D 600 - 90	Paint Driers, Liquid
D 2403 - 68 (1982) ⁶¹	Phthalic Anhydride-1308, Refined
D 363 - 90	Tricresyl Phosphate
D 2190 - 89	Vinyl Acetate

Test Methods for:

D 3362 - 84 (1987)	Acrylate Esters, Purity by Gas Chromatography
D 4415 - 91	Acrylic Acid, Determination of Dimer in
D 2192 - 89	Aldehydes and Ketones, Purity of
D 2119 - 87	Aldehydes in Styrene Monomer
D 2613 - 85 (1990) ⁶¹	Calcium and Zinc in Paint Driers by EDTA Method
D 3970 - 80 (1990) ⁶¹	Cerium in Paint Driers by Oxidimetric Determination
D 2373 - 85 (1990) ⁶¹	Cobalt in Paint Driers by EDTA Method
D 2379 - 84 (1987)	Formaldehyde Solutions, Acidity of
D 2194 - 89	Formaldehyde Solutions, Concentration of
D 2087 - 89	Formaldehyde Solutions, Iron in
D 2380 - 84 (1987)	Formaldehyde Solutions, Methanol Content of
D 3546 - 90	Formic Acid in Glacial Acetic Acid
D 1258 - 90	Glycerin, High-Gravity, Testing
D 1728 - 83	Glycerin, Phthalate Ester Color of High Gravity (Discontinued 1991†)
D 3804 - 86 (1991) ⁶¹	Iron in Paint Driers by EDTA Method
D 2374 - 85 (1990) ⁶¹	Lead in Paint Driers by EDTA Method
D 2375 - 85 (1990) ⁶¹	Manganese in Paint Driers by EDTA Method
D 3125 - 83 (1987)	Monomethyl Ether of Hydroquinone in Colorless Monomeric Acrylate Esters and Acrylic Acid
D 2999 - 85	Monopentaerythritol in Commercial Pentaerythritol by Gas Chromatography (Discontinued 1989†— Replaced by Test Method D 2195)
§D 564 - 87 (1991) ⁶¹	Paint Driers, Liquid
D 2195 - 84	Pentaerythritol
D 3989 - 81a (1990) ⁶¹	Rare Earth Metals, Total, in Paint Driers by EDTA Method
D 3962 - 80 (1984) ⁶¹	Styrene Analysis by Gas Chromatography
D 2119 - 87	Styrene Monomer, Aldehydes in
D 2120 - 87	Styrene Monomer, <i>p</i> -tert-Butylcatechol Inhibitor in
D 2340 - 82 (1987) ⁶¹	Styrene Monomer, Peroxides in
D 2121 - 84	Styrene Monomer, Polymer Content of
D 1721 - 84 (1988) ⁶¹	Tricresyl Phosphate, Permanganate Time of
D 1399 - 90	Tricresyl Phosphate, Unsaponifiable Content of
§D 1468 - 84 (1988) ⁶¹	Tricresyl Phosphate, Volatile Matter in
§D 1638 - 74 ⁶¹	Urethane Foam Isocyanate Raw Materials (Discontinued 1991†)
D 3988 - 85 (1990) ⁶¹	Vanadium in Paint Driers by EDTA Method
D 2191 - 84	Vinyl Acetate, Acetaldehyde Content of
D 2086 - 84	Vinyl Acetate and Acetaldehyde, Acidity in
D 2193 - 84	Vinyl Acetate, Hydroquinone in
D 1631 - 85	Water in Phenol and Related Materials by the Iodine Reagent Method
D 3969 - 85 (1990) ⁶¹	Zirconium in Paint Driers by EDTA Method

D 1065 - 82	Unsaponifiable Matter in Rosin
D 889 - 58 (1987)	Volatile Oil in Rosin

AROMATIC HYDROCARBONS AND RELATED MATERIALS

(see gray-edge pages 523 to 797 of Volume 06.03)

Specifications for:

D 3264 - 86	Aniline, Industrial Grade
D 836 - 84	Benzene, Industrial Grade (Discontinued 1991†)
D 835 - 90	Benzene-485, Refined (Nitration Grade)
D 2359 - 90	Benzene-535, Refined
D 4734 - 90	Benzene-545, Refined
D 3055 - 90	Cyclohexane 995
D 4077 - 91	Isopropylbenzene (Cumene)
D 3504 - 87	Maleic Anhydride
D 2439 - 91	Phenol, Refined
D 2403 - 91	Phthalic Anhydride-1308, Refined
D 2323 - 84 (1989) ^{ei}	Pyridine, Refined
D 2827 - 88 ^{ei}	Styrene Monomer 996
§D 362 - 84	Toluene, Industrial Grade (Discontinued 1991†)
D 841 - 90	Toluene, Nitration Grade
D 5211 - 91	Xylene, Feedstock for <i>p</i> -Xylene
D 843 - 90	Xylene, Nitration Grade
D 846 - 84	Xylene, Ten-Degree (Discontinued 1991†)
D 4076 - 86 (1990)	<i>o</i> -Xylene 950
D 5136 - 90	<i>p</i> -Xylene, High Purity

Test Methods for:

§D 847 - 91	Acidity of Benzene, Toluene, Xylenes, Solvent Naphthas, and Similar Industrial Aromatic Hydrocarbons
D 848 - 81 (1989) ^{ei}	Acid Wash Color of Industrial Aromatic Hydrocarbons
D 2119 - 87	Aldehydes in Styrene Monomer

- D 1218 - 87 Refractive Index and Refractive Dispersion of Hydrocarbon Liquids (see Vol 05.01)

Practices for:

- D 3436 - 91 Aniline, Sampling and Handling
- D 4297 - 89 4,4'-Isopropylidenediphenol (Bisphenol A), Sampling and Handling
- D 3437 - 89 Liquid Cyclic Products, Sampling and Handling
- D 3438 - 89 Naphthalene, Maleic Anhydride, and Phthalic Anhydride, Sampling and Handling
- D 3852 - 90 Phenol and Cresylic Acid, Sampling and Handling

Guide for:

- D 4588 - 87 p-Xylene, Analysis of (Discontinued 1992+—Replaced by Specification D 5136)

Terminology of:

- D 4790 - 89a Aromatic Hydrocarbons and Related Chemicals

GENERAL STANDARDS

Specifications for:

- D 1193 - 91 Reagent Water
- E 100 - 81 (1986) ASTM Hydrometers (see Vol 14.03)
- E 1 - 90 ASTM Thermometers (see Vol 14.03)
- E 133 - 86 Distillation Equipment (see Vol 14.02)

Test Methods for:

- E 299 - 90 Peroxides in Organic Solvents, Trace Amounts
- E 70 - 90 pH of Aqueous Solutions with the Glass Electrode (see Vol 15.05)
- E 200 - 86 Standard Solutions for Chemical Analysis, Preparation, Standardization, and Storage of (see Vol 15.05)

Practices for:

- E 300 - 86 Industrial Chemicals, Sampling
- E 691 - 87 Interlaboratory Study to Determine the Precision of a Test Method, Conducting

Definitions of Terms Relating to:

- E 12 - 70 (1986) Density and Specific Gravity of Solids, Liquids, and Gases (see Vols 04.02 and 15.05)

METRIC PRACTICE

Practice for:

- §E 380 - 91 Use of the International System of Units (SI) (the Modernized Metric System) (Excerpts) (see Related Material section)

Excerpts from Standard Practice for Use of the International System of Units (SI) (the Modernized Metric System)¹

Following are excerpts from *Standard Practice for Use of the International System of Units (SI) the Modernized Metric System E 380*, which is available as a separate publication and which appears in its entirety in Volume 14.02. Deleted are Appendixes X1, X2, X3, and X4. Added is a table of selected conversion factors from Appendix X3.

1. Scope

1.1 This standard gives guidance for application of The International System of Units (the modernized metric system) developed and maintained by the General Conference on Weights and Measures (abbreviated CGPM from the official French name *Conférence Générale des Poids et Mesures*). The name International System of Units and the international abbreviation SI² were adopted by the 11th CGPM in 1960.

1.2 Information is included on SI, a limited list of non-SI units recognized for use with SI units, and a list of conversion factors from non-SI to SI units, together with general guidance on proper style and usage.

1.3 It is hoped that an understanding of the system and its characteristics, and careful use according to this standard,

will help to avoid the degradation that has occurred in all older measurement systems.

2. SI Units and Symbols

2.1 *Classes of Units*—SI units are divided into three classes:

base units
supplementary units
derived units

2.2 *Base Units*—SI is based on seven well-defined units (see Table 1) which by convention are regarded as dimensionally independent.

2.3 *Supplementary Units*—This class contains two units, the radian and the steradian (see Table 2). At the time of the introduction of the International System, the 11th CGPM left open the question of the nature of these supplementary units. Considering that plane angle is generally expressed as the ratio between two lengths and solid angle as the ratio between an area and the square of length, the CIPM (1980) specified that in the International System the quantities plane angle and solid angle should be considered as dimen-

¹ This standard is under the jurisdiction of ASTM Committee E-43 on Metric Practice and is the direct responsibility of Subcommittee E43.10 on Standards.

Current edition approved Oct. 3, 1991. Published December 1991. Originally published in 1964 without designation as ASTM *Metric Practice Guide*, revised 1966. Adopted as standard 1968. Last previous edition E 380 - 89.

² From the French name, *Le Système International d'Unités*.

TABLE 1 Base SI Units

Quantity ³	Unit	Symbol
length	metre	m
mass	kilogram	kg
time	second	s
electric current	ampere	A
thermodynamic temperature ⁴	kelvin	K
amount of substance	mole	mol
luminous intensity	candela	cd

⁴ For a discussion of Celsius temperature see 3.4.2.

TABLE 2 Supplementary SI Units

Quantity ³	Unit	Symbol
plane angle	radian	rad
solid angle	steradian	sr

sionless derived quantities. Therefore, the supplementary units radian and steradian are to be regarded as dimensionless derived units which may be used or omitted in the expressions for derived units.

2.4 Derived Units:

2.4.1 Derived units are formed by combining base units, supplementary units, and other derived units according to the algebraic relations linking the corresponding quantities. The symbols for derived units are obtained by means of the mathematical signs for multiplication, division, and use of exponents. For example, the SI unit for velocity is the metre per second (m/s or $\text{m}\cdot\text{s}^{-1}$), and that for angular velocity is the radian per second (rad/s or $\text{rad}\cdot\text{s}^{-1}$).

2.4.2 Those derived SI units which have special names and symbols approved by the CGPM are listed in Table 3.

2.4.3 It is frequently advantageous to express derived units in terms of other derived units with special names; for example, the SI unit for electric dipole moment is usually expressed as $\text{C}\cdot\text{m}$ instead of $\text{A}\cdot\text{s}\cdot\text{m}$.

2.4.4 Some common derived units are listed in Table 4.

2.5 SI Prefixes (see 3.2 for application):

2.5.1 The prefixes and symbols listed in Table 5 are used to form names and symbols of the decimal multiples and submultiples of the SI units except for kilogram.

2.5.2 Unit of Mass—Among the base and derived units of SI, the unit of mass (kilogram) is the only one whose name, for historical reasons, contains a prefix. Names of decimal multiples and submultiples of the unit of mass are formed by attaching prefixes to the word *gram* (g).

2.5.3 These prefixes or their symbols are directly attached to names or symbols of units, forming multiples and submultiples of the units. In strict terms these must be called "multiples and submultiples of SI units," particularly in discussing the coherence of the system (see Section 5). In common parlance, the base units and derived units, along with their multiples and submultiples, are all called SI units.

3. Application of the Metric System

3.1 General—SI is the form of the metric system that is preferred for all applications. It is important that this modernized form of the metric system be thoroughly under-

³ "Quantity" as used in the headings of the tables of this standard means measurable attribute of phenomena or matter.

TABLE 3 Derived SI Units with Special Names

Quantity ³	Unit	Symbol	Formula
frequency (of a periodic phenomenon)	hertz	Hz	1/s
force	newton	N	$\text{kg}\cdot\text{m/s}^2$
pressure, stress	pascal	Pa	N/m^2
energy, work, quantity of heat	joule	J	$\text{N}\cdot\text{m}$
power, radiant flux	watt	W	J/s
quantity of electricity, electric charge	coulomb	C	$\text{A}\cdot\text{s}$
electric potential, potential difference, electromotive force	volt	V	W/A
electric capacitance	farad	F	C/V
electric resistance	ohm	Ω	V/A
electric conductance	siemens	S	A/V
magnetic flux	weber	Wb	$\text{V}\cdot\text{s}$
magnetic flux density	tesla	T	Wb/m^2
inductance	henry	H	Wb/A
Celsius temperature	degree Celsius ⁴	$^{\circ}\text{C}$	K [see 3.4.2]
luminous flux	lumen	lm	$\text{cd}\cdot\text{sr}$
illuminance	lux	lx	lm/m^2
activity (of a radionuclide)	becquerel	Bq	1/s
absorbed dose ⁵	gray	Gy	J/kg
dose equivalent	sievert	Sv	J/kg

⁴ Inclusion in the table of derived SI units with special names approved by CIPM in 1978.

⁵ Related quantities using the same unit are: specific energy imparted, kerma, and absorbed dose index.

stood and properly applied. Obsolete metric units and practices are widespread, particularly in those countries that long ago adopted the metric system, and much usage is improper. This section gives guidance concerning the limited number of cases in which units outside SI are appropriate, used, and makes recommendations concerning usage and style.

3.2 Application of SI Prefixes:

3.2.1 General—In general the SI prefixes (2.5) should be used to indicate orders of magnitude, thus eliminating nonsignificant digits and leading zeros in decimal fractions, and providing a convenient alternative to the powers-of-ten notation preferred in computation. For example:

12 300 mm becomes 12.3 m
 12.3×10^3 m becomes 12.3 km
 $0.00123 \mu\text{A}$ becomes 1.23 nA

3.2.2 Selection—When expressing a quantity by a numerical value and a unit, a prefix should preferably be chosen so that the numerical value lies between 0.1 and 1000. To minimize variety, it is recommended that prefixes representing 1000 raised to an integral power be used. However, three factors may justify deviation from the above:

3.2.2.1 In expressing area and volume, the prefixes hecto-, deka-, deci-, and centi- may be required, for example, square hectometre, cubic centimetre.

3.2.2.2 In tables of values of the same quantity, or in a discussion of such values within a given context, it is generally preferable to use the same unit multiple throughout.

3.2.2.3 For certain quantities in particular applications, one particular multiple is customarily used. For example, the millimetre is used for linear dimensions in mechanical engineering drawings even when the values lie far outside the range 0.1 to 1000 mm; the centimetre is often used for body

wave number	1 per metre	1/m

^a See 3.4.4.

measurements and clothing sizes.

3.2.3 *Prefixes in Compound Units*⁴—It is recommended that only one prefix be used in forming a multiple of a compound unit. Normally the prefix should be attached to a unit in the numerator. One exception to this is when the kilogram occurs in the denominator.

Examples:

V/m, not mV/mm, and MJ/kg, not kJ/g

3.2.4 *Compound Prefixes*—Compound prefixes, formed by the juxtaposition of two or more SI prefixes are not to be used. For example, use

1 nm, not 1 mμm
1 pF, not 1 μμF

If values are required outside the range covered by the prefixes, they should be expressed by using powers of ten applied to the base unit.

3.2.5 *Powers of Units*—An exponent attached to a symbol containing a prefix indicates that the multiple or submultiple of the unit (the unit with its prefix) is raised to the power expressed by the exponent. For example:

⁴ A compound unit is a derived unit that is expressed in terms of two or more units rather than by a single special name.

$$\begin{aligned}
 1 \text{ cm}^3 &= (10^{-2} \text{ m})^3 = 10^{-6} \text{ m}^3 \\
 1 \text{ ns}^{-1} &= (10^{-9} \text{ s})^{-1} = 10^9 \text{ s}^{-1} \\
 1 \text{ mm}^2/\text{s} &= (10^{-3} \text{ m})^2/\text{s} = 10^{-6} \text{ m}^2/\text{s}
 \end{aligned}$$

3.2.6 *Calculations*—Errors in calculations can be minimized if the base and the coherent derived SI units are used and the resulting numerical values are expressed in powers-of-ten notation instead of using prefixes.

3.3 Other Units:

3.3.1 *Units from Different Systems*—To assist in preserving the advantage of SI as a coherent system, it is advisable to minimize the use with it of units from other systems. Such use should be limited to units listed in this section.

3.3.2 Units in Use with SI (see Table 6):

3.3.2.1 *Time*—The SI unit of time is the second. This unit is preferred and should be used if practical, particularly when technical calculations are involved. In cases where time relates to life customs or calendar cycles, the minute, hour, day, and other calendar units may be necessary. For example, vehicle speed will normally be expressed in kilometres per hour.

3.3.2.2 *Plane Angle*—The SI unit for plane angle is the radian. Use of the degree and its decimal submultiples is permissible when the radian is not a convenient unit. Use of

TABLE 5 SI Prefixes

Multiplication Factor	Prefix	Symbol
1 000 000 000 000 000 000 = 10^{18}	exa	E
1 000 000 000 000 000 = 10^{15}	peta	P
1 000 000 000 000 = 10^{12}	tera	T
1 000 000 000 = 10^9	giga	G
1 000 000 = 10^6	mega	M
1 000 = 10^3	kilo	k
100 = 10^2	hecto ^A	h
10 = 10^1	deka ^A	da
0.1 = 10^{-1}	deci ^A	d
0.01 = 10^{-2}	centi ^A	c

0.000 001 = 10^{-6}	micro	μ
0.000 000 001 = 10^{-9}	nano	n
0.000 000 000 001 = 10^{-12}	pico	p
0.000 000 000 000 001 = 10^{-15}	femto	f
0.000 000 000 000 000 001 = 10^{-18}	atto	a

^A To be avoided where practical, except as noted in 3.2.2.

the minute and second is discouraged except for special fields such as cartography.

3.3.2.3 Area—The SI unit of area is the square metre (m^2). The hectare (ha) is a special name for square hectometre (hm^2). Large land or water areas are generally expressed in hectares or in square kilometres (km^2).

3.3.2.4 Volume—The SI unit of volume is the cubic metre. This unit, or one of the regularly formed multiples such as the cubic centimetre, is preferred. The special name *litre* (L)⁶ has been approved for the cubic decimetre, but use of this unit is restricted to volumetric capacity, dry measure, and measure of fluids (both gases and liquids). No prefix other than milli- or micro- should be used with litre.

3.3.2.5 Mass—The SI unit of mass is the kilogram. This unit, or one of the multiples formed by attaching an SI prefix to *gram* (g), is preferred for all applications. The megagram (Mg) is the appropriate unit for measuring large masses such as have been expressed in tons. However, the name *ton* has been given to several large mass units that are widely used in commerce and technology—the long ton of 2240 lb, the short ton of 2000 lb, and metric ton of 1000 kg (also called the *tonne*). None of these terms are SI. The term *metric ton* should be restricted to commercial usage, and no prefixes should be used with it. Use of the term *tonne* is deprecated.

⁵ See Appendix XI.11.1.

⁶ The CGPM in October 1979 approved L and l as alternative symbols for litre. Since the letter symbol l can easily be confused with the numeral 1, only the symbol L is recommended for USA use.

TABLE 6 Units in Use with SI

Quantity ³	Unit	Symbol	Definition
time	minute	min	1 min = 60 s
	hour	h	1 h = 60 min = 3600 s
	day	d	1 d = 24 h = 86 400 s
	week, month, etc.	...	...
plane angle	degree	°	1° = ($\pi/180$) rad
	minute ⁴	'	1' = ($1/60$)°
	second ⁴	"	1" = ($\pi/10 800$) rad
volume	litre ⁵	L	1 L = ($\pi/648 000$) rad
	metric ton	t	1 t = 1 dm ³ = 10^{-3} m ³
	area	ha	1 ha = 10 ⁴ m ²

⁴ Use discouraged except for special fields such as cartography.

⁵ See 3.3.2.4.

3.3.3 Units in Use with SI Temporarily (see Table 7):

3.3.3.1 Energy—The SI unit of energy, the joule, together with its multiples, is preferred for all applications. The kilowatthour is widely used, however, as a measure of electric energy. This unit should not be introduced into any new areas, and eventually it should be replaced by the megajoule.

3.3.3.2 Pressure and Stress—The SI unit of pressure and stress is the pascal (newton per square metre) and with proper SI prefixes is applicable to all such measurements. Old metric gravitational units for pressure and stress such as kilogram-force per square centimetre (kgf/cm^2) shall not be used. Widespread use has been made of other non-SI units such as bar and torr for pressure, but this use is strongly discouraged. The millibar is widely used in meteorology; this usage will continue for the present in order to permit meteorologists to communicate easily within their profession. The kilopascal should be used in presenting meteorological data to the public.

3.3.4 Units and Names to Be Abandoned—A great many metric units other than those of the SI have been defined over the years. Some of these are used only in special fields; others have found broad application in countries that adopted the metric system early. Except for the special cases discussed in the previous sections, non-SI units (as well as special names for multiples or submultiples of SI units) are to be avoided. Various categories of deprecated units are discussed in 3.3.4.1 to 3.3.4.4. The lists are not intended to be complete, but only to indicate more or less prominent examples of each category.

3.3.4.1 Cgs Units—All units peculiar to the various cgs systems (measurement systems constructed by using the centimetre, gram, and second as base units) are to be avoided. Among these units are the following, defined for mechanics, fluid mechanics, and photometry: the erg, dyne, gal, poise, stokes, stilb, phot, and lambert. Further use of the cgs units of electricity and magnetism is deprecated. This statement applies to the units designated by the general abbreviations "esu" (for electrostatic cgs unit) and "emu" (for electromagnetic cgs unit), including those units that have been given special names—the gauss, oersted, maxwell, gilbert, biot, and franklin. It also applies to the unit names formed with the prefixes ab- and stat-, for example, the abampere, statvolt, etc.

3.3.4.2 Decimal Multiples of SI Units—Those multiples of SI units that cannot be handled by using the SI prefixes are deprecated. Many such examples are covered in subsection 3.3.4.1. An additional example is the angstrom (0.1 nm).

3.3.4.3 Unit Names to Be Avoided—Special names for

TABLE 7 Units in Use with SI Temporarily

Quantity ³	Unit	Symbol	Definition
energy [see 3.3.3.1]	kilowatthour	kWh	1 kWh = 3.6 MJ
cross section	barn	b	1 b = 10^{-28} m ² = 100 fm ²

multiples and submultiples of SI units are to be avoided except for the *litre* (3.3.2.4), *metric ton* (3.3.2.5), and *hectare* (3.3.2.3). For example, do not use:

fermi	1 fermi	= 1 fm = 10^{-15} m
micron	1 micron	= 1 μ m = 10^{-6} m
millimicron	1 millimicron	= 1 nm = 10^{-9} m
are	1 are	= 1 dam ² = 100 m ²
gamma	1 gamma	= 1 nT
(magnetic flux density)		
γ (mass)	1 γ	= 1 μ g
λ (volume)	1 λ	= 1 μ L = 1 mm ³
mho	1 mho	= 1 S
candle	1 candle	= 1 cd
candlepower	1 candlepower	= 1 cd

3.3.4.4 *Miscellaneous Units*—Other non-SI units that are deprecated include the following:

calorie
grade [1 grade = $(\pi/200)$ rad]
kilogram-force
langley (= 1 cal/cm²)
metric carat
metric horsepower
millimetre of mercury
millimetre, centimetre, metre of water

standard atmosphere
(1 atm = 101.325 kPa)
technical atmosphere
(1 at = 98.0665 kPa)
torr

3.4 Other Recommendations Concerning Units:

3.4.1 Mass, Force, and Weight:

3.4.1.1 The principal departure of SI from the gravimetric system of metric engineering units is the use of explicitly distinct units for mass and force. In SI, the name kilogram is restricted to the unit of mass, and the kilogram-force (from which the suffix *force* was in practice often erroneously dropped) should not be used. In its place the SI unit of force, the newton, is used (see Fig. 1). Likewise, the newton rather than the kilogram-force is used to form derived units which include force, for example, pressure or stress ($\text{N/m}^2 = \text{Pa}$), energy ($\text{N} \cdot \text{m} = \text{J}$), and power ($\text{N} \cdot \text{m/s} = \text{W}$).

3.4.1.2 Considerable confusion exists in the use of the term *weight* as a quantity to mean either *force* or *mass*. In commercial and everyday use, the term *weight* nearly always means mass; thus, when one speaks of a person's weight, the quantity referred to is mass. This nontechnical use of the term *weight* in everyday life will probably persist. In science and technology, the term *weight of a body* has usually meant

FIG. 1 Illustration of Difference Between Mass (Unit = kilogram = kg) and Force (Unit = newton = N) (see 3.4.1)

the force that, if applied to the body, would give it an acceleration equal to the local acceleration of free fall. The adjective "local" in the phrase "local acceleration of free fall" has usually meant a location on the surface of the earth; in this context the "local acceleration of free fall" has the symbol g (commonly referred to as "acceleration of gravity") with observed values of g differing by over 0.5 % at various points on the earth's surface. The use of *force of gravity* (mass times acceleration of gravity) instead of *weight* with this meaning is recommended. Because of the dual use of the term *weight* as a quantity, this term should be avoided in technical practice except under circumstances in which its meaning is completely clear. When the term is used, it is important to know whether mass or force is intended and to use SI units properly as described in 3.4.1.1, by using kilograms for mass or newtons for force.

3.4.1.3 Gravity is involved in determining mass with a balance or scale. When a standard mass is used to balance the measured mass, the effects of gravity on the two masses are equalized, but the effects of the buoyancy of air or other fluid on the two masses are generally not equalized. When a spring scale is used, the scale reading is directly related to the force of gravity. Spring scales graduated in mass units may be properly used if both the variation in acceleration of gravity and the buoyancy corrections are not significant in their use.

3.4.1.4 The use of the same name for units of force and mass causes confusion. When the non-SI units are used, a distinction should be made between *force* and *mass*, for example, lbf to denote force in gravimetric engineering units and lb for mass.

3.4.1.5 The term *load* means either mass or force, depending on its use. A load that produces a vertically downward force because of the influence of gravity acting on a mass may be expressed in mass units. Any other load is expressed in force units.

3.4.2 *Temperature*—The SI unit of thermodynamic temperature is the kelvin (K), and this unit is properly used for expressing thermodynamic temperature and temperature intervals. Wide use is also made of the degree Celsius ($^{\circ}\text{C}$), which is the SI unit used for expressing Celsius temperature and temperature intervals. The Celsius scale (formerly called centigrade) is related directly to thermodynamic temperature (kelvins) as follows:

The temperature interval one degree Celsius equals one kelvin exactly. Celsius temperature (t) is related to thermodynamic temperature (T) by the equation:

$$t = T - T_0$$

where $T_0 = 273.15 \text{ K}$ by definition.

The International Practical Temperature Scale (IPTS) must be recognized in temperature work of extreme precision. See *ASTM STP 565, Evolution of the International Practical Temperature Scale of 1968*.

3.4.3 Linear Dimensions:

3.4.3.1 Nominal dimensions name the item; no SI equivalent is required (see Section 5 for definition of "nominal value"). For example, there is nothing "1 in" about a nominal "1-in pipe," the dimensions of which should be converted as follows:

Nominal Size, inches	Outside Diameter, inches (mm)	Wall Thickness, inches (mm)		
		Sch 40	Sch 80	Sch 160
1	1.315 (33.40)	0.133 (3.38)	0.179 (4.55)	0.250 (6.35)

Likewise, a "2 by 4" is that in name only and refers to the approximate dimensions in inches of a rough-sawn piece of green lumber, the finished dimensions of which are considerably less. A $\frac{1}{4}$ -20 UNC screw thread should continue to be identified in this manner. However, the controlling dimensions of the part, such as the pitch, major, and minor diameters of a screw thread, should be converted to SI values in accordance with 4.1 and 4.2.

3.4.3.2 Surface texture should be expressed in micrometres.

3.4.4 Quantities and Units used in Rotational Mechanics

3.4.4.1 *Angle, Angular Velocity, and Angular Acceleration*. Their SI units are rad, rad/s, and rad/s^2 respectively. In accordance with Sec. 2.3, since the radian is here taken to be dimensionless, the units 1, 1/s, and $1/\text{s}^2$ are also used when appropriate.

3.4.4.2 *Moment of Force* (Torque or Bending Moment) is force times moment arm (lever arm). Its SI unit is $\text{N}\cdot\text{m}$.

3.4.4.3 *Moment of Inertia* (I) is a property of the mass distribution of a body about an axis ($I = \sum mr^2$). Its SI unit is $\text{kg}\cdot\text{m}^2$.

3.4.4.4 *Angular Momentum* (moment of momentum) is linear momentum ($\text{kg}\cdot\text{m/s}$) times moment arm (m). Its SI unit is $\text{kg}\cdot\text{m}^2/\text{s}$. For a rotating body the total angular momentum is equal to the moment of inertia I ($\text{kg}\cdot\text{m}^2$) times the angular velocity ω (rad/s or 1/s).

3.4.4.5 *Rotational Kinetic Energy* of a rotating body is equal to $\frac{1}{2}I\omega^2$. Its SI unit is J.

3.4.4.6 *Rotational Work* is equal to torque ($\text{N}\cdot\text{m}$) times angle of rotation (rad). Its SI unit is J.

3.4.4.7 *Torsional Stiffness* (torsion constant) of a body is applied torque ($\text{N}\cdot\text{m}$) divided by angle of twist (rad). Its SI unit is $\text{N}\cdot\text{m}/\text{rad}$.

3.4.4.8 *Centripetal Acceleration*, v^2/r or $\omega^2 r$, where v is the tangential linear velocity (m/s), r the radius (m), and ω the angular velocity (rad/s) is, like any other linear acceleration, measured in SI units m/s^2 .

NOTE—Centripetal Force, equal to mass times centripetal acceleration, is, like any force in SI, measured in newtons.

3.4.5 *Impact Energy Absorption*—This quantity, often incorrectly called impact resistance or impact strength, is measured in terms of the work required to break a standard specimen; the proper unit is joule.

3.4.6 *Pressure and Vacuum*—Gage pressure is absolute pressure minus ambient pressure (usually atmospheric pressure). Both gage pressure and absolute pressure are properly expressed in pascals, using SI prefixes as appropriate. Absolute pressure is never negative. Gage pressure is positive if above ambient pressure and negative if below. Pressure below ambient is often called vacuum; whenever the term *vacuum* is applied to a numerical measure it should be made clear whether negative gage pressure or absolute pressure is meant. See 3.5.5 for methods of designating gage pressure and absolute pressure.

3.4.7.1 The values of so-called dimensionless quantities, as for example refractive index and relative permeability, are expressed by pure numbers. In these cases the corresponding SI unit is the ratio of the same two SI units and may be expressed by the number 1.

3.4.7.2 Terms such as percent, parts per thousand, and parts per million may also be used.

3.4.7.3 In all cases, the meaning must be unequivocal. Expressions like "The mole fraction of CO₂ in the sample was 1.2 parts per million" or "The mass fraction of CO₂ in the sample was 1.2 parts per million" are permissible, but would not be permissible if the word "mole" in the first expression or "mass" in the second expression were not present.

3.5 *Style and Usage*—Care must be taken to use unit symbols properly, and international agreement provides uniform rules. Handling of unit names varies because of language differences, but use of the rules included here will improve communications in the United States.

3.5.1 *Rules for Writing Unit Symbols:*

3.5.1.1 Unit symbols should be printed in upright type regardless of the type style used in the surrounding text.

3.5.1.2 Unit symbols are unaltered in the plural.

3.5.1.3 Unit symbols are not followed by a period except when used at the end of a sentence.

3.5.1.4 Letter unit symbols are written in lower-case (for example, cd) unless the unit name has been derived from a proper name, in which case the first letter of the symbol is capitalized (for example, W, Pa). The exception is the symbol for litre, L. Prefix symbols use either lower-case or upper-case letters as shown in 2.5.1. Symbols retain their prescribed form regardless of the surrounding typography. For symbols for use in systems with limited character sets, refer to ANSI X3.50 or ANSI/IEEE 260, as applicable. The symbols in ANSI X3.50 are intended for applications in the field of information processing, where unambiguous transmission of information between computers is required. The symbols in ANSI/IEEE 260 are generally consistent with those in ANSI X3.50 and are intended for communication between human beings. The symbols for limited character sets must never be used when the available character set permits the use of the proper general-use symbols as given in this standard.

3.5.1.5 When a quantity is expressed as a numerical value and a unit symbol, a space should be left between them. For example, use 35 mm, *not* 35mm, and 2.37 lm (for 2.37 lumens), *not* 2.37lm.

Exception: No space is left between the numerical value and the symbols for degree, minute, and second of plane angle, and degree Celsius. For example, use 45°, 20°C.

3.5.1.6 When a quantity expressed as a number and a unit is used in an adjectival sense, it is preferable to use a hyphen instead of a space between the number and the unit name or between the number and the symbol. Examples: A three-metre pole. . . The length is 3 m. . . A 35-mm film. . . The width is 35 mm. However, per 3.5.1.5 *Exception*, a 90° angle. . . an angle of 90°.

3.5.1.7 No space is used between the prefix and unit symbols.

3.5.1.8 Symbols, not abbreviations, should be used for units. For example, use "A" and not "amp" for ampere.

3.5.2 *Rules for Writing Names:*

3.5.2.1 Spelled-out unit names are treated as common nouns in English. Thus, the first letter of a unit name is not capitalized except at the beginning of a sentence or in capitalized material such as a title.

3.5.2.2 Plurals are used when required by the rules of English grammar and are normally formed regularly, for example, henries for the plural of henry. The following irregular plurals are recommended:

Singular	Plural
lux	lux
hertz	hertz
siemens	siemens

3.5.2.3 No space or hyphen is used between the prefix and unit name. There are three cases where the final vowel in the prefix is commonly omitted: *megohm*, *kilohm*, and *hectare*. In all other cases where the unit name begins with a vowel both vowels are retained and both are pronounced.

3.5.3 *Units Formed by Multiplication and Division:*

3.5.3.1 *With unit names:*

Product, use a space (preferred) or hyphen:

newton metre *or* newton-metre

In the case of the watt hour the space may be omitted, thus:

watthour

Quotient, use the word *per* and not a solidus:

metre per second, *not* metre/second

Powers, use the modifier *squared* or *cubed* placed after the unit name:

metre per second squared

In the case of area or volume, the modifier may be placed before the unit name:

square millimetre, cubic metre

This alternative is also allowed for derived units that include area or volume:

watt per square metre

NOTE—To avoid ambiguity in complicated expressions, symbols are preferred over words.

3.5.3.2 *With unit symbols:*

Product, use a raised dot:

N·m for newton metre

In the case of W·h, the dot may be omitted, thus:

Wh

An exception to this practice is made for computer printouts, automatic typewriter work, etc., where the raised dot is not possible, and a dot on the line may be used.

Quotient, use one of the following forms:

m/s *or* m·s⁻¹ *or* $\frac{m}{s}$

In no case should more than one solidus be used in the same

expression unless parentheses are inserted to avoid ambiguity. For example, write:

$$J/(\text{mol} \cdot \text{K}) \text{ or } J \cdot \text{mol}^{-1} \cdot \text{K}^{-1} \text{ or } (J/\text{mol})/\text{K},$$

but not

$$J/\text{mol/K}$$

3.5.3.3 Symbols and unit names should not be mixed in the same expression. Write:

$$\text{joules per kilogram or } J/\text{kg or } J \cdot \text{kg}^{-1}$$

but not

$$\text{joules/kilogram nor joules/kg nor joules} \cdot \text{kg}^{-1}$$

3.5.4 Numbers:

3.5.4.1 The recommended decimal marker is a dot on the line. When writing numbers less than one, a zero should be written before the decimal marker.

3.5.4.2 Outside the United States, the comma is often used as a decimal marker. In some applications, therefore, the common practice in the United States of using the comma to separate digits into groups of three (as in 23,478) may cause ambiguity. To avoid this potential source of confusion, recommended international practice calls for separating the digits into groups of three, counting from the decimal point toward the left and the right, and using a small space to separate the groups. In numbers of four digits on either side of the decimal point the space is usually not necessary, except for uniformity in tables.

Examples:

2.141 596 73 722 7372 0.1335

Where this practice is followed, the space should be narrow (approximately the width of the letter "i"), and the width of the space should be constant even if, as is often the case in printing, variable-width spacing is used between words. Exceptions: In certain specialized applications, such as engineering drawings and financial statements, the practice of using a space for a separator is not customary.

3.5.4.3 Because *billion* means a thousand million (prefix *giga*) in the United States but a million million (prefix *tera*) in most other countries, this term and others, such as trillion, should be avoided in technical writing.

3.5.4.4 Use of M to indicate thousands, as in MCF for thousands of cubic feet, or in MCM for thousands of circular mils, of MM to indicate millions, of C to indicate hundreds, etc., is deprecated because of obvious conflicts with the SI prefixes.

3.5.5 Attachment—Attachment of letters to a unit symbol as a means of giving information about the nature of the quantity under consideration is incorrect. Thus MWe for "megawatts electrical (power)," Vac for "volts ac," and kJt for "kilojoules thermal (energy)" are not acceptable. For this reason, no attempt should be made to construct SI equivalents of the abbreviations "psia" and "psig," so often used to distinguish between absolute and gage pressure. If the context leaves any doubt as to which is meant, the word *pressure* must be qualified appropriately. For example:

"... at a gage pressure of 13 kPa"

or

"... at an absolute pressure of 13 kPa"

Where space is limited, such as on gages, nameplates, graph labels, and in table headings, it is permissible to use the unit symbol followed by a space and the modifier in parentheses. For example: V (ac) and V (dc); kPa (gage) and kPa (absolute).

3.5.6 Pronunciation—Some recommended pronunciations in English are shown in Table 8.

4. Rules for Conversion and Rounding

4.1 General:

4.1.1 Conversion factors to change a value of a quantity expressed in non-SI units to the corresponding value of that quantity expressed in the International System of Units may be exact or approximations adequate for the particular task. The rules in this section are based on using either exact or approximate factors such as those of seven-digit factors listed in Appendix X3. In some cases the quantity is such that factors with fewer digits are appropriate.

4.1.2 Conversion of quantities should be handled with careful regard to the implied correspondence between the accuracy of the data and the given number of digits. In all conversions, the number of significant digits retained should be such that accuracy is neither sacrificed nor exaggerated. (For guidance concerning significant digits see 4.3.) For example, a length of 125 ft converts exactly to 38.1 m. If, however, the 125-ft length had been obtained by rounding to the nearest 5 ft, the conversion should be given as 38 m; and if it had been obtained by rounding to the nearest 25 ft, the conversion should be given as 40 m.

4.1.3 Proper conversion procedure is to multiply a value by a conversion factor that is more accurate than is required; the result is then rounded to the appropriate number of significant digits. For example, to convert 3 feet 2 7/16 inches to metres: $(3 \times 0.3048) + (2.5625 \times 0.0254) = 0.979\,487\,5$ m, which rounds to 0.979 m. Do not round either the conversion factor or the quantity before performing the multiplication, as accuracy may be reduced. After the conversion, the

SI value may be expressed by a multiple or submultiple unit of SI by the use of an appropriate prefix, for example, 979 mm.

4.2 Accuracy and Rounding—A conversion obtained by multiplying a value by a seven-digit factor usually gives a product with more digits than the original value. The converted value must be rounded to the proper number of significant digits commensurate with the intended accuracy. Conversions usually yield a product with more digits than the original value. The practical aspect of measuring must be considered when using SI equivalents. If a scale having division of 1/16 inch was suitable for making the original measurements, a metric scale having divisions of 1 mm is obviously suitable for measuring in SI units. Similarly, a gage or caliper graduated in divisions of 0.02 mm is comparable to one graduated in divisions of 0.001 in. Analogous situations exist in mass, force, and other measurements. Many techniques are used to guide the determination of the proper number of significant digits in the converted values. Two different approaches to rounding of quantities are here described—one for general use and the other for conversion of dimensions involving mechanical interchangeability.

4.2.1 General Conversion—This approach depends on first establishing the intended precision or accuracy of the quantity as a necessary guide to the number of digits to retain. This precision should relate to the number of digits in the original, but in many cases this is not a reliable indicator. A figure 1.1875 may be a very accurate decimalization of a noncritical 1 1/16 that should have been expressed 1.19. On the other hand, the value 2 may mean "about 2," or it may mean a very accurate value of 2 which should have been written 2.0000. It is therefore necessary to determine the intended precision of a quantity before converting. This estimate of intended precision should never be smaller than the accuracy of measurement and should usually be smaller than one tenth the tolerance if one exists. After estimating the precision of the dimension, the converted dimension should be rounded to a minimum number of significant digits (see 4.3) such that a unit of the last place is equal to or smaller than the converted precision. Examples:

1. A stirring rod 6 in. long. In this case, precision is estimated to be about 1/2 in (± 1/4 in). Converted, this is 12.7 mm. The converted dimension 152.4 mm should be rounded to the nearest 10 mm, or 150 mm.

2. 50 000 lbf/in² (psi) tensile strength. In this case, precision is estimated to be about ± 200 lbf/in² (± 1.4 MPa) based on an accuracy of ± 0.25 % for the tensile tester and other factors. Therefore, the converted dimension, 344.7379 MPa, should be rounded to the nearest whole unit, 345 MPa.

3. Test pressure 200 ± 15 lbf/in² (psi). Since one tenth of the tolerance is 3 lbf/in² (20.68 kPa), the converted dimension should be rounded to the nearest 10 kPa. Thus, 1378.9514 ± 103.421 35 kPa becomes 1380 ± 100 kPa.

4.2.2 Special Cases:

4.2.2.1 Converted values should be rounded to the minimum number of significant digits that will maintain the required accuracy, as discussed in 4.1.2. In certain cases deviation from this practice to make use of convenient or whole numbers may be feasible, in which case the word "approximate" must be used following the conversion. For example:

1 1/8 in = 47.625 mm, exact
47.6 mm, normal rounding
47.5 mm (approx) rounded to preferred num
48 mm (approx) rounded to whole number

4.2.2.2 A quantity stated as a limit, such as "less than" or "maximum," must be handled so that the limit is not violated. For example, a specimen "at least 101.6 mm wide" requires a width of at least 101.6 mm, or at least 102 mm.

4.3 Significant Digits:

4.3.1 When converting integral values of units, the precision must be given to the implied or required precision of the integral value to be converted. For example, the value "1 in" may be intended to represent 4, 4.0, 4.00, 4.0000 in, or even greater accuracy. Obviously, the converted value must be carried to a sufficient number of digits to maintain the accuracy implied or required in the original quantity.

4.3.2 Any digit that is necessary to define the value or quantity is said to be significant. When measuring the nearest 1 m, a distance may be recorded as 1500 m. This number has three significant digits. If the measurement had been made to the nearest 0.1 m, the distance may have been 157.4 m; this number has four significant digits.

4.3.3 Zeros may be used either to indicate a specific value like any other digit, or to indicate the order of magnitude of a number. The 1970 United States population was rounded to thousands was 203 185 000. The six left-hand digits of this number are significant; each measures a unit of the order of magnitude of the number rounded to the nearest thousand. The three right-hand digits are zeros which merely indicate the order of magnitude of the number rounded to the nearest thousand. The identification of significant digits is possible through knowledge of the circumstances. For example, the number 1000 may be rounded from 999.7, in which case only one zero is significant, or it may be rounded from 999.7, in which case all three zeros are significant.

4.3.4 Occasionally data required for an investigation are drawn from a variety of sources where they have been recorded with varying degrees of refinement. Special care must be observed when such data are to be added, subtracted, multiplied, or divided.

4.3.4.1 The rule for addition and subtraction is that the answer shall contain no significant digits farther to the right than occurs in the least precise number. Consider the addition of three numbers drawn from three sources, each of which reported data in millions, the second in thousands, and the third in units:

163 000 000
217 885 000
96 432 768
477 317 768

The total indicates a precision that is not valid. The numbers should first be rounded to one significant digit farther to the right than that of the least precise number, then the sum taken as follows:

163 000 000
217 900 000
96 400 000
477 300 000

The total is then rounded to 477 000 000 as called for by the rule. Note that if the second of the figures to be added had been 217 985 000, the rounding before addition would have produced 218 000 000, in which case the 0 following 218 would have been a significant digit.

4.3.4.2 The rule for multiplication and division is that the *product* or *quotient* shall contain no more significant digits than are contained in the number with the *fewest significant digits* used in the multiplication or division. The difference between this rule and the rule for addition and subtraction should be noted; the latter rule merely requires rounding of digits that lie to the right of the last significant digit in the least precise number. The following illustration highlights this difference:

Multiplication:

$113.2 \times 1.43 = 161.876$, rounded to 162

Division:

$113.2 \div 1.43 = 79.16$, rounded to 79.2

Addition:

$113.2 + 1.43 = 114.63$, rounded to 114.6

Subtraction:

$113.2 - 1.43 = 111.77$, rounded to 111.8

The above product and quotient are limited to three significant digits since 1.43 contains only three significant digits. In contrast, the rounded answers in the addition and subtraction examples contain four significant digits.

4.3.4.3 Numbers used in the above illustrations have all been estimates or measurements. Numbers that are exact counts are treated as though they consist of an infinite number of significant digits. More simply stated, when a count is used in computation with a measurement the number of significant digits in the answer is the same as the number of significant digits in the measurement. If a count of 40 is multiplied by a measurement of 10.2, the product is 408. However, if 40 were an estimate accurate only to the nearest 10, and hence contained but one significant digit, the product would be 400.

4.4 *Rounding Values*⁷:

4.4.1 When a figure is to be rounded to fewer digits than the total number available, the procedure should be as follows:

4.4.1.1 When the first digit discarded is less than 5, the last digit retained should not be changed. For example, 3.463 25, if rounded to four digits, would be 3.463; if rounded to three digits, 3.46.

4.4.1.2 When the first digit discarded is greater than 5, or if it is a 5 followed by at least one digit other than 0, the last digit retained should be increased by one unit. For example 8.376 52, if rounded to four digits, would be 8.377; if rounded to three digits 8.38.

4.4.1.3 When the first digit discarded is exactly 5, followed only by zeros, the last digit retained should be rounded upward if it is an odd number, but no adjustment made if it

is an even number. For example, 4.365, when rounded to three digits, becomes 4.36. The number 4.355 would also round to the same value, 4.36, if rounded to three digits.

4.5 *Conversion of Linear Dimensions of Interchangeable Parts*—The use of the exact relation 1 in = 25.4 mm generally produces converted values containing more decimal places than are required for the desired accuracy. It is therefore necessary to round these values suitably and at the same time maintain the degree of accuracy in the converted values compatible with that of the original values.

4.5.1 *General*—The number of decimal places given in Table 9 for rounding converted toleranced dimensions relates the degree of accuracy to the size of the tolerances specified. Two methods of using Table 9 are given: Method A, which rounds to values nearest to each limit, and Method B, which rounds to values always inside the limits.

In Method A, rounding is effected to the nearest rounded value of the limit, so that, on the average, the converted tolerances remain statistically identical with the original tolerances. The limits converted by this method, where acceptable for interchangeability, serve as a basis for inspection.

In Method B, rounding is done systematically toward the interior of the tolerance zone so that the converted tolerances are never larger than the original tolerances. This method must be employed when the original limits have to be respected absolutely, in particular, when components made to converted limits are to be inspected by means of original gages.

Method A—The use of this method ensures that even in the most unfavorable cases neither of the two original limits will be changed by more than 5 % of the value of the tolerance. Proceed as follows:

(a) Calculate the maximum and minimum limits in inches.

(b) Convert the corresponding two values exactly into millimetres by means of the conversion factor 1 in = 25.4 mm.

(c) Round the results obtained to the nearest rounded value as indicated in Table 9, depending on the original tolerance in inches, that is, on the difference between the two limits in inches.

Method B—This method must be employed when the original limits may not be violated, for instance, certain critical mating parts. In extreme cases, this method may increase the lower limit a maximum of 10 % of the tolerance and decrease the upper limit a maximum of 10 % of the tolerance.

(a) Proceed as in Method A step (a).

(b) Proceed as in Method A step (b).

(c) Round each limit toward the interior of the tolerance, that is, to the next lower value for the upper limit and to the next higher value for the lower limit.⁸

Examples:

⁷ Adapted from ISO R370 (7).

⁸ If the digits to be rounded are zeros, the retained digits remain unchanged.

anged.

A dimension is expressed in inches as 1.950 $\pm$ 0.016
The limits are 1.934 and 1.966
Conversion of the two limits into millimetres
gives 49.1236 and 49.9364
Method A—The tolerance equals 0.032 in and
thus lies between 0.004 and 0.04 in (see Table
9). Rounding these values to the nearest 0.01
mm, the values in millimetres to be employed
for these two limits are 49.12 and 49.94
Method B—Rounding toward the interior of the
tolerance, millimetre values for these two
limits are 49.13 and 49.93
This reduces the tolerance to 0.80 instead of 0.82 mm given by Method A.

4.5.2 Special Method for Dimensions with Plus and Minus Deviations—In order to avoid accumulation of rounding errors, the two limits of size normally are converted separately; thus, they must first be calculated if the dimension consists of a basic size and two deviations. However (except when Method B is specified) as an alternative, the basic size may be converted to the nearest rounded value and each of the deviations converted toward the interior of the tolerance. This method, which sometimes makes conversion easier, gives the same maximum guarantee of accuracy as Method A, but usually results in smaller converted tolerances.

4.5.3 Special Methods for Limitation Imposed by Accuracy of Measurements—If the increment of rounding for the tolerances given in Table 9 is too small for the available accuracy of measurement, limits that are acceptable for interchangeability must be determined separately for the dimensions. For example, where accuracy of measurement is limited to 0.001 mm, study shows that values converted from 1.0000 $\pm$ 0.0005 in can be rounded to 25.413 and 25.387 mm instead of 25.4127 and 25.3873 mm with little disadvantage, since neither of the two original limits is exceeded by more than 1.2 % of the tolerance.

4.5.4 Positional Tolerance—If the dimensioning consists solely of a positional tolerance around a point defined by a nontoleranced basic dimension, the basic dimension must be converted to the nearest rounded value and the positional variation (radius) separately converted by rounding downward.

4.5.5 Toleranced Dimension Applied to a Nontoleranced Position Dimension—If the toleranced dimension is located in a plane, the position of which is given by nontoleranced basic or gage dimension, such as when dimensioning certain conical surfaces, proceed as follows:

(a) Round the converted reference gage arbitrarily, to the nearest convenient value.

(b) Calculate exactly, in the converted unit of measurement, new maximum and minimum limits of the specified tolerance zone, in the new plane defined by the new basic dimension.

(c) Round these limits in conformity with the rules in 4.4. For example, a cone of taper 0.05 in/in has a diameter of 1.000 $\pm$ 0.002 inch in a reference plane located by the nontoleranced dimension 0.9300 in. By virtue of the taper of the cone, the limits of the tolerance zone depend on the position of the reference plane. Consequently, if the dimension 0.9300 in = 23.6220 mm is rounded to 23.600 mm (that is, a reduction of 0.022 mm), each of the two original limits, when converted exactly into millimetres, must be corrected by 0.022 $\times$ 0.05 = 0.0011 mm, in the appropriate sense, before being rounded.

4.5.6 Consideration of Maximum and Minimum Material

Condition—The ability to assemble mating parts depends on a "go" condition at the maximum material limits of the parts. The minimum material limits, which are determined by the respective tolerances, are often not as critical from a functional standpoint. Accordingly, it may be desirable to employ a combination of Methods A and B in certain conversions by using Method B for the maximum material limits and Method A for the minimum material limits. Alternatively, it may be desirable to round automatically the converted minimum material limits outside the original limits to provide greater tolerances for manufacturing.

4.5.7 While the technique described in 4.5 provides good accuracy of conversion, it will often result in dimensions that are impractical for actual production use. For conversions intended for production, it is usually necessary to round to fewer decimal places and apply design judgment to each dimension to assure interchangeability.

4.6 Other Units:

4.6.1 Temperature—General guidance for converting tolerances from degrees Fahrenheit to kelvins or degrees Celsius is given below:

Conversion of Temperature
Tolerance Requirements

Tolerance, °F	Tolerance, K or °C
2 ($\pm$ 1)	1 ($\pm$ 0.5)
4 ($\pm$ 2)	2 ($\pm$ 1)
10 ($\pm$ 5)	6 ($\pm$ 3)
20 ($\pm$ 10)	11 ($\pm$ 5.5)
30 ($\pm$ 15)	17 ($\pm$ 8.5)
40 ($\pm$ 20)	22 ($\pm$ 11)
50 ($\pm$ 25)	28 ($\pm$ 14)

Normally, temperatures expressed in a whole number of degrees Fahrenheit should be converted to the nearest 0.5 kelvin (or degree Celsius). As with other quantities, the number of significant digits to retain will depend upon implied accuracy of the original dimension, for example:

100 $\pm$ 5°F; implied accuracy estimated to be 2°F.

37.7777 $\pm$ 2.7777°C rounds to 38 $\pm$ 3°C.

1000 $\pm$ 50°F; implied accuracy estimated to be 20°F.

537.7777 $\pm$ 27.7777°C rounds to 540 $\pm$ 30°C.

4.6.2 Pressure or Stress—As with other quantities, pressure or stress values may be converted by the principle given above. Values with an uncertainty of more than 2 % may be converted without rounding by approximate factors:

$$1 \text{ lbf/in}^2 (1 \text{ psi}) = 7 \text{ kN/m}^2 = 7 \text{ kPa}$$

5. Terminology

5.1 To help ensure consistently reliable conversion and rounding practices, a clear understanding of the related nontechnical terms is a prerequisite.

TABLE 9 Rounding Tolerances Inches to Millimetres

Original Tolerance, inches		Fineness of Rounding, mm
at least	less than	
0.000 04	0.000 4	0.0001
0.000 4	0.004	0.001
0.004	0.04	0.01
0.04	0.4	0.1
0.4		1

5.2 Certain terms used in this standard are defined as follows:

accuracy (as distinguished from precision)—the degree of conformity of a measured or calculated value to some recognized standard or specified value. This concept involves the systematic error of an operation, which is seldom negligible.

approximate value—a value that is nearly but not exactly correct or accurate.

coherent system of units—a system of units of measurement in which a small number of base units, defined as dimensionally independent, are used to derive all other units in the system by rules of multiplication and division with no numerical factors other than unity (see Appendix X1.9).

deviation—variation from a specified dimension or design requirement, usually defining upper and lower limits (see also tolerance).

digit—one of the ten arabic numerals (0 to 9).

dimension—a geometric element in a design, such as length or angle, or the magnitude of such a quantity.

feature—an individual characteristic of a part, such as screw-thread, taper, or slot.

figure (numerical)—an arithmetic value expressed by one or more digits.

inch-pound units—units based upon the yard and the pound commonly used in the United States of America and defined by the National Institute of Standards and Technology. Note that units having the same names in other countries may differ in magnitude.

nominal value—a value assigned for the purpose of convenient designation; existing in name only.

precision (as distinguished from accuracy)—the degree of mutual agreement between individual measurements, namely repeatability and reproducibility.

significant digit—any digit that is necessary to define a value or quantity (see 4.3).

tolerance—the total amount by which a quantity is allowed to vary; thus the tolerance is the algebraic difference between the maximum and minimum limits.

Condensed Index of Committee D-1 Standards—1992¹

This index references all standards under the jurisdiction of Committee D-1 on Paint and Related Coatings and Materials plus several others of auxiliary usefulness. It attempts to include what is relevant and exclude what is incidental to the concept of each standard. Being designed for Committee D-1 usage it omits much of the detailed information provided in the regular more comprehensive index, the latter being intended for users with a broader range of product concern. Its structure employs cross-indexing from specific to general and vice-versa, with the objective of avoiding redundancy while guiding the user with dispatch to the desired and related material. The criterion for the selection of index terms is whether they might reasonably occur to an index user familiar with the technology of organic coatings. Index users encountering errors or other deficiencies should report them promptly by writing to ASTM Subcommittee D01.18 in care of ASTM Headquarters. Changes will be included in the next edition along with entries for new standards. Subcommittee chairmen should review the standards under their jurisdiction for that purpose.

¹ This index was developed by ASTM Committee D-1 and is not an official ASTM document. It is published for information purposes only.

Abrasive blasting
profile of blast-cleaned steel, D4417(1)
Abrasion resistance
air blast abrasive test, D658(1)
falling sand/abrasive test, D968(1)
Taber Abraser test, D4060(1)
wear resistance, of traffic paint, D913(1)
wet abrasion/scrubbing, D2486, D213(1)

Accelerated exposure tests
See Exposure - accelerated

Acetaldehyde
acetaldehyde, spec., D4710(3)
acidity, test, D2086(3)
Acetate ester solvents
purity, alcohol content, D3545(2)

See Amyl acetate
n-Butyl acetate
Ethyl acetate
Hexyl acetate
Isobutyl acetate
Isopropyl acetate
Methyl amyl acetate
n-Propyl acetate
-Sa Glycol ether acetates

Acetic acid (glacial)
formic acid in glacial acetic acid, D3546(3)
specification, D3620(3)

Acetone
acetone tolerance, of bodied oils, D1950(3)
alkalinity, test, D1614(3)
permanganate time, test, D1363(3)
specification, D329(3)

Acetylene black, See Carbon black

Acidity/alkalinity, (pH)
acetaldehyde, spec., D4710(3)
acetone, test, D1613, 1614(3)
chemically cleaned/etched concrete, D4262(1)
electrocoat baths, D4584(1)
fatty quaternary ammon. chlorides, D2081(3)
formaldehyde solutions, test, D2379(3)
hydroxypropyl methylcellulose, D2363(2)
milliequivalence, electrocoat baths, D4370(1)
phenol-formaldehyde, D4613(3)
pigments, D1208(2)
volatile solvents, D1613(3)

Acid number (value)
fatty acids, D1980(3)
lac resins, test, D29(2)
organic coating materials, D1639(1)
pine tars and pine tar oils, test, D856(3)
rosin oil, test, D1131(3)
rosin test, D465(3)
tall oil, test, D803(3)
turpentine and pinene, test, D233(3)
-Sa Saponification number

Acid resistance (of paints/related coatings)
clear coatings on aluminum, test, D3260(1)
Acrylate esters, purity, D3362(3)

Acrylic acid
dimer content, D4415(3)
specification, D4416(3)
Acrylic emulsion paints, See Artists' Paints
Adhesion/Cohesion
by cut tape test, D3359(1)

Dillon dynamometer test, D4796(1)
HIPAC coatings, D3730(1)
portable tester, pull-off strength, D4541(1)
prepainted fabricated metal, D4145(1)
scrape test on smooth surfaces, D2197(1)
traffic marking paints, materials, D4796(1)
zinc-rich primer on steel, D4146(1)
Air blast abrasion tester, D658(1)

Alcohol resistance, furniture lacquer, D2571(1)

Alcohol solvents

See Amyl alcohol, D319(3)
n-Butyl alcohol (1-Butanol), D304(3)
sec-Butyl alcohol (2-Butanol), D1007(3)
2-Ethylhexanol, D5008(3)
Isobutyl alcohol (isobutanol), D1719(3)
Isopropyl alcohol (isopropanol), D770(3)
Methyl isobutyl carbinol, D2635(3)
Methanol (Methyl alcohol), D1152(3)
n-Propyl alcohol (n-propanol), D3622(3)

Aldehydes, purity, test, D2192(3)

Algae (algal growth) See Biodeterioration

Aliphatic hydrocarbon solvents
See Mineral (petroleum) spirits
VM&P naphtha

Alkali resistance, of varnishes, D1647(1)

Alkyds/alkyd resins

carboxylic acids content, D2455(2)
fatty acids content, D1398(2)
isophthalic acid content, D2690(2)
phthalic anhydride content, D563, D1306(2)
polyhydric alcohol, D1615, 2456, 2998(2)

Alkyds/alkyd resins (cont'd)

rosin acid content, D1469(2)
silicon content, D3733(2)
test methods, selection of, D2689(2)
unsaponifiable matter content, D1397(2)
-Sa Paints, solvent-reducible

Aluminum (metal surfaces)

acid/mortar resistance, of coatings, D3260(1)
preparation for painting, D1730, D1731(1)

Aluminum powder and paste

sampling/testing, D480(2)
specification, D962(2)

Aluminum silicate (anhydrous)

analysis, D718(2)
specification, D3619(2)

-Sa Pigments, general properties

Aluminum silicate (hydrous)

analysis, D718(2)
specification, D603(2)

-Sa Pigments, general properties

Amidoamines, See Fatty amines

Amino resins

free formaldehyde content, D1979(3)
test procedures, practice, D4277(2)
nitrogen content, D1013(2)
solvent tolerance test, D1198(2)

Amines/amine values

See Fatty amines

Fatty quaternary/amine chlorides

Amyl acetate, synthetic primary, D3540(3)

Amyl alcohol (synthetic), spec., D319(3)

Analysis See Chemical analysis

Aniline

sampling and handling, practice, D3436 (3)
specification, D3264(3)

**Section 6****PAINTS, RELATED COATINGS, AND AROMATICS**

This index covers the standards and related material appearing in Volumes 06.01, 06.02, and 06.03. The boldface references are to the ASTM designations; the standards appear in each volume in alphanumeric order. Proposed methods and specifications carry the index reference, "(Proposed)"; they appear, as does other ancillary material, in the Related Material (gray-edged) section in the back of the book. A triangle (Δ) preceding the ASTM designation denotes that Adjunct Material for the standard is published separately; the Adjunct No. is given in the standard. A Combined Index, covering the standards appearing in all volumes of the 1992 *Annual Book of ASTM Standards*, is issued as Volume 00.01.

Alphabetization in the index is letter-for-letter, with no consideration to punctuation or word division. Initial prepositions of (indented) subentries are ignored for alphabetization.

In the preparation of indexes, every attempt has been made to index standards on three levels: (1) by main subject, using general and specific search terms; (2) by test methods or other significant sections of ASTM standards; and (3) by cross-references to locate main subject entry terms. (*See also* references are abbreviated as *Sa* and appear under main entry terms.) Specification F451, for Acrylic Bone Cements (Volume 13.01), illustrates ASTM's method of indexing.

INDEX TERMS FOR MAIN SUBJECT**ENTRY****Adhesives—surgical implant materials**

acrylic bone cements (for internal orthopedic prostheses),
self-curing, spec., F 451

Orthopaedic medical devices—bone

acrylic bone cements (for internal orthopedic prostheses),
self-curing, spec., F 451

INDEX TERMS FOR TESTS**Compressive strength**

acrylic bone cements, test, F 451

Doughing time

acrylic bone cements, test, F 451

CROSS-REFERENCES**Bone—cement**

See Adhesives—surgical implant materials

Fixation materials

Sa Orthopaedic medical devices (*headings*)

Index of ASTM Standards, Section 6

A

Ablative antifouling paint systems

See Antifouling coating system

Abrading

abrading concrete, practice, D 4259 (06.01)

Abrasion resistance

abrasion resistance of organic coatings, by falling abrasive, test, D 968 (06.01)

abrasion resistance of printed matter, by the ga-cat comprehensive abrasion test, D 5181 (06.01)

air blast abrasion tester, Δ D 658 (06.01)

scrub-to-failure of interior latex flat wall paints, test, D 2486 (06.01)

Taber abraser, test, D 4060 (06.01)

wet abrasion resistance of interior paints to scrubbing, by weight loss, test, D 4213 (06.01)

Abrasives/abrasivity

conductimetric analysis of water-soluble ionic contamination of blasting abrasives, test, D 4940 (06.01)

profile of abrasive blast-cleaned steel surfaces, in laboratory/field/fabricating shop, test, D 4417 (06.01)

resistance of steel pipeline coatings to abrasion, by slurry of coarse abrasive/water, test, G 6 (06.01)

Absorption

gloss differences between surfaces of similar appearance, method for visual evaluation, D 4449 (06.01)

Absorption spectroscopy

lead content in paint, by direct aspiration atomic absorption spectroscopy, test, D 4834 (06.01)

Absorptive coatings

relative tinting strength of chromatic paints, test, D 4838 (06.01)

Accelerated testing—paints/related coatings/materials

accelerated testing of paints/varnishes/lacquers/related products, using filtered open flame carbon-arc light/water exposure apparatus, practice, D 822 (06.01)

coatings (applied to metal substrates), practice, D 4141 (06.01)

edge performance of composite wood products under surfactant accelerated moisture stress, test, D 2065 (06.01)

evaluation of painted/coated specimens subjected to corrosive environments, method, D 1654 (06.01)

nonvolatile content of latexes, test, D 4758 (06.02)

wet abrasion resistance of interior paints to scrubbing, by weight loss, test, D 4213 (06.01)

wood used as panels in weathering tests of coatings, spec., D 358 (06.01)

Accelerated testing—pipeline coatings

cathodic disbonding of pipeline coatings, accelerated procedure, test, G 8 (06.01)

penetration resistance of pipeline coatings, by blunt rod test, G 17 (06.01)

resistance of steel pipeline coatings to abrasion, by slurry of coarse abrasive/water, test, G 6 (06.01)

Accelerated testing—salt spray (fog) testing

salt spray (fog) testing, method, B 117 (06.01)

Accelerated testing—wood products

wood used as panels in weathering tests of coatings, spec., D 358 (06.01)

Acetaldehyde (AA)

See Aldehydes

acetaldehyde content of vinyl acetate, test, D 2191 (06.03)

acetaldehyde, spec., D 4710 (06.03)

acidity in vinyl acetate and acetaldehyde, test, D 2086 (06.03)

Acetate esters

alcohol content/purity of acetate esters, by gas chromatography, test, D 3545 (06.03)

Acetic acid content

cellulose acetate, test, D 871 (06.02)

Acetic acid (glacial)

formic acid in glacial acetic acid, test, D 3546 (06.03)

glacial (99.8 %) acetic acid (for use in paint/varnish/lacquer/related products), spec., D 3620 (06.03)

Acetone

acetone in methanol (methyl alcohol), test, D 1612 (06.03)

acetone, spec., D 329 (06.03)

acetone tolerance of heat-bodied drying oils, test, D 1950 (06.03)

alkalinity in acetone, test, D 1614 (06.03)

apparent pH of water insoluble phenol-formaldehyde resins, test, D 4613 (06.02)

permanganate time of acetone/methanol, test, D 1363 (06.01)

Acetophenone

analysis of major organic impurities in phenol products, in cumene process, by gas chromatography, test, D 4961 (06.03)

Acetyl content

acetone in methanol (methyl alcohol), test, D 1612 (06.03)

apparent acetyl content of cellulose acetate propionates/butyrate, test, Δ D 817 (06.02)

combined acetyl/acetic acid content of cellulose acetate, test, D 871 (06.02)

Acetylene black

See Carbon black (headings)

Acid content

acid/base milliequivalent content of (anodic/cathodic) electrocoat baths/their ultrafiltrates, test, D 4370 (06.01)

Acid-insoluble extenders

acid-insoluble extenders in (iron/copper phthalocyanine/ultramarine) blue pigments, test, D 1135 (06.02)

Acidity, alkalinity, pH—paints/related coatings/materials

acetaldehyde, spec., D 4710 (06.03)

acid/amine value of fatty quaternary ammonium chlorides, test, D 2081 (06.03)

acid/base milliequivalent content of (anodic/cathodic) electrocoat baths/their ultrafiltrates, test, D 4370 (06.01)

acidity in vinyl acetate and acetaldehyde, test, D 2086 (06.03)

acidity in volatile solvents/chemical intermediates (used in paint/varnish/lacquer/related products), test, D 1613 (06.03)

acidity of benzene/toluene/xylene/solvent naphthas/similar industrial aromatic hydrocarbons, test, D 847 (06.03)

alkalinity in acetone, test, D 1614 (06.03)

apparent pH of electrocoat baths, test, D 4584 (06.01)

apparent pH of water insoluble phenol-formaldehyde resins, test, D 4613 (06.02)

cellulose acetate propionates/butyrate, test, Δ D 817 (06.02)

cellulose acetate, test, D 871 (06.02)

ethylcellulose, test, D 914 (06.02)

formaldehyde solutions, test, D 2379 (06.03)

hydrogen sulfide/sulfur dioxide (qualitative) of industrial aromatic hydrocarbons, test, D 2363 (06.02)

methyl acrylate, spec., D 4709 (06.03)

methylcellulose, test, D 1347 (06.02)

moisture content of pigments, D 1208 (06.02)

pH of chemically cleaned/etched concrete surfaces, test, D 4262 (06.01)

Acidity, alkalinity, pH—plastics

cellulose acetate propionates/butyrate, test, Δ D 817 (06.02)

Acid number

See Saponification number/value

rosin oil, test, D 1131 (06.03)

rosin, test, D 465 (06.03)

sampling and testing pine tars/pine-tar oils, method, D 856 (06.03)

sampling and testing turpentine, method, D 233 (06.03)

tall oil, methods of testing, D 803 (06.03)

Acid phthalic anhydride

See Phthalic anhydride

- resistance**
 acid/mortar resistance of factory-applied clear coatings on extruded aluminum products, test, **D 3260 (06.01)**
- soluble extenders**
 acid-soluble extenders in (iron/copper phthalocyanine/ultramarine) blue pigments, test, **D 1135 (06.02)**
- value**
 acid/amine value of fatty quaternary ammonium chlorides, test, **D 2076 (06.03)**
 acid value of organic coating materials, test, **D 1639 (06.01)**
 fatty acids and polymerized fatty acids, test, **D 1980 (06.03)**
 sampling/testing lac resins (orange shellac/button lac/garnet lac/bleached lac), test, **D 29 (06.02)**
- wash color**
 aromatic hydrocarbons/related chemicals, terminology, **D 4790 (06.03)**
- acetate esters**
 purity, by gas chromatography, test, **D 3362 (06.03)**
- acrylic acid**
 acrylic acid dimer in acrylic acid/unsaturated organic acids, test, **D 4415 (06.03)**
 alacial acrylic acid (99.0 % grade), spec., **D 4416 (06.03)**
- acrylic latex paints**
 Sa Latex paints
 artists' acrylic emulsion paints, spec., **D 5098 (06.01)**
 artists' paints (oil/resin-oil/alkyd), spec., **D 4302 (06.01)**
 preparing drawdowns of artists' paste paints, practice, **D 4941 (06.01)**
 water content of water-reducible paints, by direct injection into gas chromatograph, test, **D 3792 (06.01)**
- acrylic polymer content**
 qualitative identification of polymers in emulsion paints, by infrared analysis/pyrolysis-gas liquid chromatography, practice, **D 3168 (06.01)**
- active oxygen content—organic solvents**
 trace peroxides (≥ 5 –80 ppm), using spectrophotometer, test, **E 299 (06.03)**
- adhesion—paints/related coatings/materials**
 adhesion of coating films to metallic substrates, by tape test, **D 3359 (06.01)**
 adhesion of organic coatings to plastic substrates, by direct tensile testing, **D 5179 (06.01)**
 clear/pigmented organic coatings, test, **D 1308 (06.01)**
 evaluation of painted/coated specimens subjected to corrosive environments, method, **D 1654 (06.01)**
 mar resistance of organic coatings, using balanced beam scrape adhesion and mar test, **D 5178 (06.01)**
 organic coatings on prepainted deformed metallic sheets, test, **D 4145 (06.01)**
 pull-off strength of coatings, using portable adhesion testers, test, **D 4541 (06.01)**
 by scrape test, **D 2197 (06.01)**
 zinc-rich primer/chromate complex coatings (on steel), test, **D 4146 (06.01)**
- adhesive bonding**
 bond strength of thermoplastic traffic marking materials, using cement bricks/steel cubes, test, **D 4796 (06.01)**
- adhesives**
 amount of liquid separated as upper layer from a viscous solution/dispersion containing dispersed solids, test, **D 4948 (06.01)**
 commercial hexanes, spec., **D 1836 (06.03)**
- adhesives—structural**
 trace peroxides (≥ 5 –80 ppm), using spectrophotometer, test, **E 299 (06.03)**
- adulteration**
 See Purity
- African ochre**
 See Ocher
- Aged coatings**
 assessing the condition of aged coatings on steel surfaces, guide, **D 5065 (06.01)**
- Aggregate**
 impact resistance of pipeline coatings, by limestone drop test, **G 13 (06.01)**
- Air blast abrasion tester**
 paints and related coatings, test, **D 658 (06.01)**
- Air blast cleaning**
 oil/water presence in compressed air (used for coating application/air blast cleaning/abrasive blast cleaning), **D 4285 (06.01)**
- Air-cooled xenon-arc lamp**
 operating light-exposure apparatus (xenon-arc type) with/without water for exposure of nonmetallic materials, practice, **G 26 (06.01)**
- Air dry coatings**
 nonvolatile content of latexes, test, **D 4758 (06.02)**
- Airless spray application**
 Sa Spray—Applied coatings
 testing industrial water-reducible coatings, guide, **D 4712 (06.01)**
- Air particulate filter samples**
 lead/chromium content (in air particulate filter samples of lead chromate type pigment dusts), by atomic absorption spectroscopy, test, **D 4358 (06.02)**
- Alcohol-benzene-soluble content**
 alcohol-benzene soluble matter in cellulose, test, **D 1794 (06.02)**
- Alcohol content**
 alcohol content/purity of acetate esters, by gas chromatography, test, **D 3545 (06.03)**
 polyhydric alcohols in alkyd resins, qualitative analysis, test, **D 2998 (06.02)**
- Alcohol resistance**
 wood furniture lacquers, test, **D 2571 (06.01)**
- Alcohols (C_4 – C_{13})**
 plasticizer grade, chemical/physical analysis (selection/use of test procedures), **E 852 (06.03)**
- Aldehydes**
 peroxides in styrene monomer, test, **D 2119 (06.03)**
 purity of aldehydes and ketones, test, **D 2192 (06.03)**
- Algae**
 presence of and removing microbial (fungal/algal) growth on paint/related coatings, guide, **D 4610 (06.01)**
- Aliphatic hydrocarbons**
 See Hydrocarbons—aliphatic
- Alkaline cresylate solutions**
 cresylic acid content (of alkaline cresylate solutions), chemical analysis, **D 3439 (06.03)**
- Alkaline earth carbonates**
 acid-insoluble extenders in (iron/copper phthalocyanine/ultramarine) blue pigments, test, **D 1135 (06.02)**
- Alkalinity**
 alkalinity in acetone, test, **D 1614 (06.03)**
- Alkali resistance**
 clear/pigmented organic coatings, test, **D 1308 (06.01)**
 dried varnish films, test, **D 1647 (06.01)**
- Alkyds/alkyd resins**
 alkyd resins, selection of test methods, practice, **D 2689 (06.02)**
 artists' paints (oil/resin-oil/alkyd), spec., **D 4302 (06.01)**
 dichloromethane/1,1,1-trichloroethane content in paints/coatings, by direct injection gas chromatography, test, **D 4457 (06.01)**
 fatty acid content, test, **D 1398 (06.02)**
 glycerol/ethylene glycol/pentaerythritol in alkyd resins, test, **D 1615 (06.02)**
 identification of carboxylic acids in alkyd resins **D 2455 (06.02)**
 identification of polyhydric alcohols in alkyd resins, qualitative/quantitative analysis, test, **D 2456 (06.02)**

Index of ASTM Standards, Section 6

Alkyds/alkyd resins

- isophthalic acid content of alkyd/polyester resins, test, D 2690 (06.02)
- phthalic anhydride content (in absence of dibasic acids), test, D 563 (06.02)
- phthalic anhydride content (in presence of dibasic acids), by gravimetric test, D 1306 (06.02)
- polyhydric alcohols in alkyd resins, qualitative analysis, test, D 2998 (06.02)
- rosin acids content, test, D 1469 (06.02)
- silicon content of silicone polymers/silicone modified alkyds, by atomic absorption spectrophotometry, test, D 3733 (06.02)
- specific gravity at 25/25°C, test, D 1963 (06.03)
- testing industrial water-reducible coatings, guide, D 4712 (06.01)
- unsaponifiable matter content, test, D 1397 (06.02)

All-day testing

See Twenty-four hour testing

Alternative indicator method

- total, primary, secondary, and tertiary amine values of fatty amines, test, D 2074 (06.03)

Alumina

- acid-soluble extenders (in iron/copper phthalocyanine/ultramarine) blue pigments, test, D 1135 (06.02)
- alumina/iron oxide in magnesium silicate pigment, test, D 717 (06.02)

Alumina hydrate

- acid-insoluble extenders (in iron/copper phthalocyanine/ultramarine) blue pigments, test, D 1135 (06.02)

Aluminum

- acid/mortar resistance of factory-applied clear coatings on extruded aluminum products, test, D 3260 (06.01)
- preparation of aluminum/aluminum-alloy surfaces (for painting), practice, D 1730 (06.01)
- preparation of hot-dip aluminum surfaces (for painting), practice, D 1731 (06.01)

Aluminum alloys

- preparation of aluminum/aluminum-alloy surfaces (for painting), practice, D 1730 (06.01)
- preparation of hot-dip aluminum surfaces (for painting), practice, D 1731 (06.01)

Aluminum coatings

See Coatings—aluminum

Aluminum oxide (Al₂O₃) content

- aluminum oxide in aluminum silicate (hydrous/anhydrous) pigment, test, D 718 (06.02)
- aluminum oxide in titanium dioxide (TiO₂) pigments, test, D 1394 (06.02)

Aluminum potassium silicate

See Mica pigment

Aluminum powder and paste

See Pigments (headings)

- aluminum powder/paste pigments for paints, spec., D 962 (06.02)
- sampling/testing flaked aluminum powders/pastes, methods, D 480 (06.03)

Aluminum reduction method

- total titanium in white titanium pigments, by aluminum reduction method, test, D 1394 (06.02)

Aluminum silicate pigments

- aluminum silicate (hydrous/anhydrous) pigment, analysis, test, D 718 (06.02)
- aluminum silicate pigments (anhydrous), spec., D 3619 (06.02)
- aluminum silicate pigments (hydrous), spec., D 603 (06.02)

American turpentine

See Turpentine

Amidoamines

See Fatty amidoamines

Amine resins

See Resins (headings)

- amine resins—solvent tolerance, test, D 1198 (06.02)

Amines

See Fatty amines

Amines content

- percent of amines (primary/secondary/tertiary) in fatty amines, test, D 2083 (06.03)

Amine value

- acid/amine value of fatty quaternary ammonium chlorides, test, D 2076 (06.03)

Amine values (total/primary/secondary/tertiary)

- fatty amines/amidoamines/diamines, by reference potentiometric method, test, D 2073 (06.03)
- fatty amines, by alternative indicator method, test, D 2074 (06.03)

Aminolysis

- identification of polyhydric alcohols in alkyd resins, qualitative/quantitative analysis, test, D 2456 (06.02)

Amino resins

- amino resins, selecting test procedures, practice, D 4277 (06.03)
- free formaldehyde content of amino resins, test, D 1979 (06.02)

Ammonium hydroxide content

- ammonium hydroxide group (alumina/iron oxide) in magnesium silicate pigment, test, D 717 (06.02)

Amyl acetate

- primary (synthetic) amyl acetate (98 % grade), spec., D 3540 (06.03)

Amyl alcohol (synthetic)

- amyl alcohol (synthetic), spec., D 319 (06.03)

Anatase-rutile ratio

- ratio of anatase to rutile in titanium dioxide (TiO₂) pigments, by x-ray diffraction, test, D 3720 (06.02)

Angle of incidence

- gloss differences between surfaces of similar appearance, for visual evaluation, D 4449 (06.01)

Aniline

- industrial grade aniline, spec., D 3264 (06.03)
- nitrobenzene in aniline, test, D 4589 (06.03)
- sampling and handling aniline, practice, D 3436 (06.03)

Aniline point

- aniline point/mixed aniline point of petroleum products, hydrocarbon solvents, test, D 611 (06.03)
- sampling and testing dipentene, method, D 801 (06.03)

Animal black

See Bone black

ANSI replacement standards

- use of protective coating standards in nuclear power plants, selecting ASTM standards, guide, D 5144 (06.01)

Anti-corrosion pigments—basic lead silicochromate

- basic lead silicochromate pigment, spec., D 1648 (06.02)
- chromium trioxide content of basic lead silicochromate pigment, test, D 1844 (06.02)

Anti-corrosion pigments—red lead

- lead peroxide/true red lead content of dry red lead pigments, test, D 49 (06.02)
- red lead pigment, spec., D 83 (06.02)

Anti-corrosion pigments—strontium chromate

- chemical analysis of strontium chromate pigment, test, D 1845 (06.02)
- strontium chromate pigment, spec., D 1649 (06.02)

Anti-corrosion pigments—zinc chromate

- analysis, D 444 (06.02)
- zinc yellow (zinc chromate) pigments, spec., D 478 (06.02)

Anti-corrosion pigments—zinc hydroxy phosphite

- analysis, D 4450 (06.02)
- zinc hydroxy phosphite pigment, spec., D 4462 (06.02)

Antifouling coating system

- erosion testing of antifouling paints, using high velocity water, test, D 4938 (06.01)
- organotin release rates of antifouling coating systems in sea water, using graphite furnace atomic absorption spectrophotometry (GF-AAS), test, D 5108 (06.01)

- shallow submergence test, D 3623 (06.01)
- subjecting marine antifouling coating to bifouling and fluid shear forces in natural seawater, test, D 4939 (06.01)
- antifouling paint pigments—copper powder
- chemical analysis of cuprous oxide/copper pigments, test, D 283 (06.02)
- copper powder (for antifouling paints), spec., D 964 (06.02)
- antifouling paint pigments—cuprous oxide
- chemical analysis of cuprous oxide/copper pigments, test, D 283 (06.02)
- cuprous oxide (for antifouling paints), spec., D 912 (06.02)
- antifouling paint pigments—mercuric oxide
- analysis, D 284 (06.02)
- mercuric oxide for use in antifouling paints, spec., D 911 (06.02)
- antimony content
- antimony content (low concentrations) in solids of liquid coatings/dried films, by atomic absorption spectroscopy, test, D 3717 (06.01)
- antimony oxide
- See* Pigments (*headings*)
- antimony content (low concentrations) in solids of liquid coatings/dried films, by atomic absorption spectroscopy, test, D 3717 (06.01)
- antimony oxide content of white pigment (separated from solvent-type paints), test, D 2350 (06.02)
- anti-sag meter
- sag resistance of paints, using a multinoth applicator, test, D 4400 (06.01)
- apparent acetyl content
- apparent acetyl content of cellulose acetate propionate/butyrate, test, D 817 (06.02)
- apparent tack
- apparent tack of printing inks/vehicles, by inkometer, test, D 4361 (06.01)
- appearance of materials
- bleeding characteristics, of dry pigments, test, D 279 (06.02)
- blistering (of paints/related coatings), D 714 (06.01)
- chalking (of white/lightly tinted exterior paint films), practice, D 4214 (06.01)
- checking (of exterior paints), test, D 660 (06.01)
- clarity/cleanliness of (nonpigmented) paint and ink liquids, by visual examination, test, D 2090 (06.02, 06.03)
- clear/pigmented organic coatings, test, D 1308 (06.01)
- cracking (of exterior paints), test, D 661 (06.01)
- degree of rusting on painted steel surfaces, method, D 610 (06.01)
- erosion (of exterior paints), D 662 (06.01)
- evaluating degree of bleeding of traffic/pavement marking paint, test, D 868 (06.01)
- flaking (of exterior paints), D 772 (06.01)
- gas checking/draft test (of varnish films), D 1643 (06.01)
- hiding power of paints, by reflectometry, test, D 2805 (06.01)
- hiding power—relative dry hiding power (of paints/related coatings), test, D 344 (06.01)
- laboratory evaluation of degree of bleeding of traffic/pavement marking paint, test, D 969 (06.01)
- preparing drawdowns of artists' paste paints, practice, D 4941 (06.01)
- printing inks/ink films/related materials, selecting test methods, guide, D 5010 (06.01)
- selection/preparation of coating specimens, practice, D 3964 (06.01)
- testing industrial water-reducible coatings, guide, D 4712 (06.01)
- testing solvent-borne architectural (interior/exterior) coatings, guide, D 5146 (06.01)
- Application properties
- testing industrial water-reducible coatings, guide, D 4712 (06.01)
- Application viscosity (for paints/related products)
- high shear viscosity (of paints/varnishes/related products), by ICI cone/plate viscometer, test, D 4287 (06.01)
- Aqueous coatings
- sag resistance of paints, using a multinoth applicator, test, D 4400 (06.01)
- Aqueous leachates (in pigments)
- water-soluble salts in pigments, by measuring specific resistance of pigment leachate, test, D 2448 (06.02)
- Aqueous slurries
- See* Slurries
- Architectural coatings
- blocking resistance of trade sales paints, test, D 4946 (06.01)
- evaluating architectural paints for purchase by state/local governments, practice, D 3927 (06.01)
- index to selection and use of testing procedures, D 2833 (06.01)
- interior latex semigloss/gloss paints, selecting test methods, guide, D 4540 (06.01)
- leveling of aqueous/nonaqueous paints (in light/white tints), by draw-down method, test, D 4062 (06.01)
- practical washability of organic coatings, test, D 4828 (06.01)
- testing solvent-borne architectural (interior/exterior) coatings, guide, D 5146 (06.01)
- wet-to-dry hiding change of architectural coatings, test, D 5007 (06.01)
- Architectural paints and coatings
- hiding power of architectural paints applied by roller, test, D 5150 (06.01)
- print resistance of architectural paints, test, D 2064 (06.01)
- Architectural sandstone
- preparatory surface cleaning of architectural sandstone, practice, D 5107 (06.01)
- Aromatic hydrocarbons
- See* Hydrocarbons (*headings*)
- Aromatic potentiometer titrator
- acid/base milliequivalent content of (anodic/cathodic) electrocoat baths/their ultrafiltrates, test, D 4370 (06.01)
- Aromatics content
- aromatics (ethylbenzene and eight-carbon (C_8 /heavier) content in mineral spirits, by gas chromatography, test, D 3257 (06.03)
- chemical analysis of benzene, by gas chromatography, test, D 4492 (06.03)
- Arsenic content
- arsenic in paint, test, D 2348 (06.01)
- Arsenic trisulfide
- See* Orpiment content
- Artists' paints
- artists' acrylic emulsion paints, spec., D 5098 (06.01)
- artists' paints (oil/resin-oil/alkyd), spec., D 4302 (06.01)
- artists' watercolor paints, spec., D 5067 (06.01)
- labeling art materials for chronic health hazards, practice, D 4236 (06.01)
- lightfastness of pigments (in artists' paints), test, D 4303 (06.01)
- preparing drawdowns of artists' paste paints, practice, D 4941 (06.01)
- relative tinting strength of chromatic paints, test, D 4838 (06.01)
- Asbestine
- See* Magnesium silicate
- Ash content
- soluble cellulose nitrate, testing, methods, D 301 (06.02)
- Ash content—paints/related coatings/materials
- acid/amine value of fatty quaternary ammonium chlorides, test, D 2077 (06.03)
- ashing cellulose, test, D 3516 (06.02)
- cellulose acetate propionates/butyrate, test, D 817 (06.02)
- cellulose acetate, test, D 871 (06.02)
- drying oils and fatty acids, test, D 1951 (06.03)

Index of ASTM Standards, Section 6

Ash content—paints/related coatings/materials

- ethylcellulose, test, D 914 (06.02)
- hydrogen sulfide/sulfur dioxide (qualitative) of industrial aromatic hydrocarbons, test, D 2363 (06.02)
- hydroxyethylcellulose, test, D 2364 (06.02)
- methylcellulose, test, D 1347 (06.02)
- moisture content of pigments, D 1208 (06.02)
- rosin, after burning and ignition, test, D 1063 (06.03)
- sampling and testing pine tars/pine-tar oils, method, D 856 (06.03)
- sampling/testing lac resins (orange shellac/button lac/garnet lac/bleached lac), test, D 29 (06.02)
- tall oil, methods of testing, D 803 (06.03)

Atmospheres—conditioning/testing

- standard environments for conditioning/testing paint/varnish/lacquer/related materials, spec., D 3924 (06.01)

Atmospheric analysis

- design/fabrication of flue gas desulfurization system components (for protective lining application), spec., D 4618 (06.01)
- inspection of linings in operating flue gas desulfurization systems, practice, D 4619 (06.01)

Atomic absorption

- See Spectrophotometry—atomic absorption

Atomic absorption spectrophotometry

- See Spectrophotometry—atomic absorption

Atomic absorption spectroscopy

- See Spectroscopy—atomic absorption

Automatic spray

- producing films of uniform thickness of paint/varnish/related products on test panels, test, D 823 (06.01)

Automotive coatings/paints

- amount of volatile organic compound (VOC) released from solventborne automotive coatings and available for removal in a VOC control device (abatement), test, D 5087 (06.01)
- gloss of high-gloss metallic/nonmetallic surfaces, by gonimetry, method, E 430 (06.01)
- transfer efficiency under production conditions for spray application of automotive paints, by weight basis, practice, D 5066 (06.01)
- viscosity of paints/related materials, by ISO flow cups, test, D 5125 (06.03)

B

Bac-dray bleached lac

- See Bleached lac

Backfill

- impact resistance of pipeline coatings, by limestone drop test, G 13 (06.01)
- penetration resistance of pipeline coatings, by blunt rod test, G 17 (06.01)

Bacteria/bacterial control

- resistance to mold growth on surface of interior paint coatings (in an environmental chamber), test, D 3273 (06.01)

Bacteria/bacterial control—paints/related coatings/materials

- resistance of emulsion paints (in containers) to attack by microorganisms, test, D 2574 (06.01)
- resistance to mold growth on surface of interior paint coatings (in an environmental chamber), test, D 3273 (06.01)

Baked coatings

- nonvolatile content of latexes, test, D 4758 (06.02)

Baker-Philippoff equation

- intrinsic viscosity of cellulose acetate, using modified Baker-Philippoff equation, test, D 871 (06.02)

Baking (paints/related coatings)

- effects of overbaking on organic coatings, practice, D 2454 (06.01)

Balanced beam scrape adhesion and mar tester

- mar resistance of organic coatings, using balanced beam scrape adhesion and mar test, D 5178 (06.01)

Ball drop method

- viscosity of cellulose derivatives, by ball-drop method, D 1343 (06.02)

Bar codes

- abrasion resistance of printed matter, by the abrasive abrasion test, D 5181 (06.01)

Barite

- See Barium sulfate pigments

Barium sulfate

- acid-soluble extenders in (iron/copper phthalocyanine/ultramarine) blue pigments, test, D 1138 (06.02)

Barium sulfate content

- barium sulfate content in barium sulfate pigment, test, D 715 (06.02)

Barium sulfate pigments

- See Pigments (general properties)

- barium sulfate pigment, analysis, test, D 715 (06.02)

- barium sulfate pigments, spec., D 602 (06.02)

Barriers

- comparative corrosion preventive characteristics of materials used for joints/couplings/fittings/patches in pipeline coatings, test, G 18 (06.01)

Bartlett white lead

- See Basic sulfate white lead

Barytes

- barium sulfate pigments, spec., D 602 (06.02)

Base content

- acid/base milliequivalent content of (anodic/cathodic) electrocoat baths/their ultrafiltrates, test, D 4370 (06.01)

Basic carbonate white lead

- basic carbonate white lead pigment, spec., D 81 (06.02)
- white lead—chemical analysis, test, D 1301 (06.02)

Basic lead silicochromate

- basic lead silicochromate pigment, spec., D 1648 (06.02)
- chromium trioxide content of basic lead silicochromate pigment, test, D 1844 (06.02)

Basic sulfate white lead

- white lead—chemical analysis, test, D 1301 (06.02)

Beilstein analysis

- field identification of coatings, test, D 5043 (06.01)

Bend testing—coatings

- effects of outdoor weathering on pipeline coatings, test, G 11 (06.01)
- mandrel bend test of attached organic coatings, test, D 522 (06.01)
- specific bendability of pipeline coatings, test, G 10 (06.01)

Benzene

- acidity of benzene/toluene/xylenes/solvent naphtha/solvent industrial aromatic hydrocarbons, test, D 847 (06.03)
- acid wash color, test, D 848 (06.03)
- apparent density of industrial aromatic hydrocarbons, test, D 2935 (06.03)
- aromatic hydrocarbons/related chemicals, terminology, D 4790 (06.03)
- benzene content in hydrocarbon solvents, by gas chromatography, test, D 4367 (06.03)
- carbon disulfide content of aromatic hydrocarbons, by spectrophotometry, test, D 2324 (06.03)
- chemical analysis of benzene, by gas chromatography, test, D 4492 (06.03)
- commercial density (of pure liquid chemicals), test, D 3505 (06.03)
- cyclic hydrocarbon products, by gas chromatography, test, D 4534 (06.03)
- distillation, test, D 850 (06.03)
- impurities in high-purity ethylbenzene, by gas chromatography, test, D 5060 (06.03)
- purity/benzene content of cyclohexane 995, by gas chromatography, test, D 3054 (06.03)

- purity of hydrocarbons from freezing points, test, D 1016 (06.03)
 - refined benzene-485 (nitration grade), spec., D 835 (06.03)
 - refined benzene-535, spec., D 2359 (06.03)
 - refined benzene-545, spec., D 4734 (06.03)
 - sampling/handling liquid cyclic products (at ambient temperature), practice, D 3437 (06.03)
 - solidification point, test, D 852 (06.03)
 - thiophene content of benzene, by spectrophotometry, test, D 1685 (06.03)
 - thiophene content of refined benzene, by gas chromatography (with flame photometric detection), test, D 4735 (06.03)
 - total non-aromatic/trace monocyclic hydrocarbon aromatic hydrocarbons in high-purity benzene/toluene/mixed xylenes, by gas chromatography, test, D 2360 (06.03)
 - volume/weight of industrial aromatic hydrocarbons, method, D 1555 (06.03)
- tin white
 - See Basic carbonate white lead
- tintal pigments
 - See Antifouling paint pigments (headings)
- deterioration
 - See Deterioration
- biological data analysis
 - subjecting marine antifouling coating to biofouling and fluid shear forces in natural seawater, test, D 4939 (06.01)
- bisphenol A
 - sampling/handling 4,4'-isopropylidene diphenol (bisphenol-A), practice, D 4297 (06.03)
 - solidification point of 4,4'-isopropylidenediphenol (Bisphenol A), test, D 4493 (06.03)
 - solution color of 4,4'-isopropylidenediphenol (dissolved in methanol), test, D 4789 (06.03)
- bituminous materials (general)
 - penetration resistance of pipeline coatings, by blunt rod test, G 17 (06.01)
 - resistance of steel pipeline coatings to abrasion, by slurry of coarse abrasive/water, test, G 6 (06.01)
 - water in petroleum products/bituminous materials, by distillation, test, D 95 (06.01, 06.03)
- black box exposure test
 - accelerated outdoor exposure tests of coatings (applied to metal substrates), practice, D 4141 (06.01)
- black iron oxide
 - See Iron oxide black
- black pigments
 - See Bone black pigment
 - See Carbon black pigment
 - See Lampblack pigment
- blade applicator
 - producing films of uniform thickness of paint/varnish/related products on test panels, test, D 823 (06.01)
- blanc fixe
 - See Pigments (headings)
- blast-cleaned steel
 - profile of abrasive blast-cleaned steel surfaces, in laboratory/field/fabricating shop, test, D 4417 (06.01)
- blast cleaning
 - standard pictorial surface preparation standards for painting steel surfaces, A D 2200 (06.01)
- bleached lac
 - dry, regular and refined, spec., D 207 (06.02)
 - sampling/testing lac resins (orange shellac/button lac/garnet lac/bleached lac), test, D 29 (06.02)
- bleeding
 - bleeding characteristics, of dry pigments, test, D 279 (06.02)
 - evaluating degree of bleeding of traffic/pavement marking paint, test, A D 868 (06.01)
 - laboratory evaluation, of degree of bleeding of traffic/pavement marking paint, test, D 969 (06.01)
- blended silane-siloxane materials
 - nonvolatile content in silanes/siloxanes/silane-siloxane blends used in masonry water-repellent treatments, test, D 5095 (06.01)
- blistering
 - evaluating degree of blistering, test, A D 714 (06.01)
 - testing water resistance of coatings, using controlled condensation, practice, D 4585 (06.01)
 - testing water resistance of coatings, using water fog apparatus, practice, D 1735 (06.01)
- blocking
 - blocking resistance of trade sales paints, test, D 4946 (06.01)
 - organic coatings on wood substrates, test, D 2793 (06.01)
 - pressure mottling/blocking resistance of organic coatings (on metal substrates), test, D 3003 (06.01)
- blotching
 - reporting paint film failures characteristic of exterior latex paints, classification, D 1848 (06.01)

- broad-band filter reflectometry
 - directional reflectance factor (45-deg 0-deg) of opaque specimens, by broad-band filter reflectometry, test, E 97 (06.01)

Bromide content**Bromide content**

titanium dioxide content in paint, by x-ray fluorescence spectroscopy, test, D 4764 (06.01)

Bromine index

aromatic hydrocarbons, by coulometric titration, test, D 1492 (06.03)

Bronze blue

See Iron blue

Bronze powders

See Gold bronze powder

Brookfield viscometer

See Viscometers—Brookfield

Brown iron oxide

See Sienna (burnt and raw)

See Umber (burnt and raw)

chemical analysis, method, D 50 (06.02)

iron oxide black (natural)- chemical analysis, test, D 3872 (06.02)

natural red/brown iron oxide pigments, spec., D 3722 (06.02)

synthetic brown iron oxide pigment, spec., D 3724 (06.02)

Brunswick blue

See Iron blue

Brunswick green

See Chrome green

Brush-application behavior

testing industrial water-reducible coatings, guide, D 4712 (06.01)

Brush drag

comparison of the brush drag of latex paints, test, D 4958 (06.01)

Brushes

preparation of paint brushes for evaluation, practice, D 5068 (06.01)

Bubble test

viscosity of transparent liquids, by bubble time method, test, D 1545 (06.01, 06.02, 06.03)

Bulk density

See Density—apparent (bulk)

Burning characteristics—paints/related coatings/materials

fire retardancy of paints, by cabinet method, test, D 1360 (06.01)

small-scale evaluation of fire-retardant paints, by 2-foot tunnel method, test, D 3806 (06.01)

sustained burning (of liquid mixtures), by Seta-flash tester (open cup), test, D 4206 (06.01, 06.03)

sustained burning (of low viscosity liquid mixtures), by Wick test, D 4207 (06.03)

Burnt sienna

See Pigments (headings)

chemical analysis of yellow/orange/red/brown pigments containing iron/manganese, test, D 50 (06.02)

raw/burnt sienna pigments, spec., D 765 (06.02)

Butadiene

purity of hydrocarbons from freezing points, test, D 1016 (06.03)

Butane

purity of hydrocarbons from freezing points, test, D 1016 (06.03)

1-Butanol

See *n*-Butyl alcohol

2-Butanol

See sec-Butyl alcohol

2-Butanone

See Methyl ethyl ketone (MEK)

Butoxyethanol

2-butoxyethanol, spec., D 330 (06.03)

Button lac

orange shellac and (button lac/garnet lac), spec., D 237 (06.02)

sampling/testing lac resins (orange shellac/button lac/garnet lac/bleached lac), test, D 29 (06.02)

***n*-Butyl acetate**

alcohol content/purity of acetate esters, by gas chromatography, test, D 3545 (06.03)

n-butyl acetate (all grades), spec., D 4615 (06.03)

***n*-Butyl acrylate**

n-butyl acrylate, spec., D 3547 (06.03)

purity, by gas chromatography, test, D 3362 (06.03)

unreacted monomer content of latexes using capillary gas chromatography, test, D 4827 (06.02)

***n*-Butyl acrylate/methacrylate**

unreacted monomer content of latexes, by gas-liquid chromatography, test, D 4747 (06.02)

***n*-Butyl alcohol**

n-butyl alcohol (butanol), spec., D 304 (06.03)

sec-Butyl alcohol

sec-butyl alcohol, spec., D 1007 (06.03)

Butylated melamine-formaldehyde resins

See Resins

Butylcatechol inhibitor content

p-*tert*-butylcatechol (TBC) in styrene monomer, test, D 2120 (06.03)

residual *p*-*tert*-butylcatechol (TBC) in styrene monomer, by addition of NaOH, test, D 4590 (06.03)

Butyl glycol

See Butoxyethanol

***n*-Butyl methacrylate**

unreacted monomer content of latexes using capillary gas chromatography, test, D 4827 (06.02)

Butyraldehyde

See Resins (headings)

poly(vinyl butyral)- chemical analysis, test, D 1396 (06.01)

Butyryl content

cellulose acetate propionates, test, D 817 (06.02)

C**C₄-C₁₃ alcohols**

chemical/physical analysis, selection/use of test procedure, E 852 (06.03)

Cabinet method

fire retardancy of paints, by cabinet method, test, D 1360 (06.01)

Cadmium content

lead/cadmium/cobalt content (low concentrations) in nonvolatile portion of liquid coatings/dried films, by atomic absorption spectroscopy, test, D 3335 (06.01)

Calcium borosilicate

analysis, D 4487 (06.02)

calcium borosilicate pigments, spec., D 4288 (06.02)

Calcium carbonate

calcium carbonate pigment, spec., D 1199 (06.02)

Calcium content

calcium/zinc content, by EDTA method, test, D 2613 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectroscopy, test, D 4085 (06.02)

zinc dust (metallic zinc powder), test, D 521 (06.02)

Calcium oxide (CaO) content

calcium borosilicate, test, D 4487 (06.02)

calcium oxide in magnesium silicate pigment, test, D 717 (06.02)

Calcium paint driers

See Driers

Calculating test results

calculating formulation physical constants of paints/coatings, practice, D 5201 (06.01)

Calibration

conductivity cell for conductimetric analysis of water, test, D 4940 (06.01)

ionic contamination of blasting abrasives, test, D 4940 (06.01)

Chloride content—paints/related coatings/materials

ethylcellulose, test, D 914 (06.02)

hydrogen sulfide/sulfur dioxide (qualitative) of industrial
aromatic hydrocarbons, test, D 2363 (06.02)

methylcellulose, test, D 1347 (06.02)

sodium glycolate content of sodium carboxymethylcellulose,
test, D 1439 (06.02)

trace (total) chloride (organic/inorganic) in liquid aromatic
hydrocarbons, test, D 5194 (06.03)

Chlorinated hydrocarbons

dichloromethane/1,1,1-trichloroethane content in paints/
coatings, by direct injection gas chromatography, test,
D 4457 (06.01)

Chlorinated phenol preservative content

wood products, qualitative test for, D 2921 (06.01)

Chlorine content

cellulose, test, D 2641 (06.02)

epoxy resins/compounds, test, D 4301 (06.02)

hydrolyzable chlorine content of liquid epoxy resins,
D 1726 (06.02)

total chlorine content of liquid epoxy resins, test,
D 1847 (06.02)

Chloroform-insolubles content

chloroform insoluble matter in oil/cia oil, test, D 1958 (06.03)

Chromate coatings

formability/adhesion of zinc-rich primer/chromate coatings
coatings (on steel), test, D 4146 (06.01)

relative tinting strength of chromatic paints, test, D 4838 (06.03)

Chromaticity

See Color (headings)

Chromatic pigments

zinc yellow (zinc chromate) pigments, spec., D 473 (06.02)

Chromatography—gas (detergents)

methoxyl/hydroxypropyl substitution (of cellulose ether
products), by Zeisel technique, test, D 3876 (06.03)

Chromatography—gas (paints/related coatings)

identification of oils and oil acids in solvent-reducible
test, D 2245 (06.03)

identification of polyhydric alcohols in alkyd resins,
qualitative/quantitative analysis, test, D 2456 (06.02)

Chromatography—gas (paints/related coatings/materials)

acrylate esters, purity, test, D 3362 (06.03)

alcohol content/purity of acetate esters, by gas chromatography,
test, D 3545 (06.03)

analysis of major organic impurities in phenol produced by
cumene process, by gas chromatography, test, D 4961 (06.03)

analysis of major organic impurities in phenol produced by
cumene process, by gas chromatography, test, D 4961 (06.03)

analysis of purities/impurities of styrene, test, D 3062 (06.03)

analysis of *p*-xylene, method, D 3798 (06.03)

analysis of styrene by capillary gas chromatography, test,
D 5135 (06.03)

aromatics (ethylbenzene and eight-carbon (C₈) heavier than
mineral spirits, test, D 3257 (06.03)

benzene content in hydrocarbon solvents, by gas chromatography,
test, D 4367 (06.03)

benzene content of cyclic hydrocarbon products, by gas
chromatography, test, D 4534 (06.03)

chemical analysis of benzene, by gas chromatography, test,
D 4492 (06.03)

dichloromethane/1,1,1-trichloroethane content in paints/
coatings, by direct injection gas chromatography, test,
D 4457 (06.01)

ethoxyl substitution in cellulose ether products, by gas
chromatography, test, D 4794 (06.02)

ethyl methyl pentanol content/purity value of 2-ethylhexanol,
by gas chromatography, test, D 5008 (06.03)

fatty acid composition, by gas-liquid chromatography of methyl
esters, test, D 1983 (06.03)

identification of carboxylic acids in alkyd resins, D 2455 (06.02)

identification of polyhydric alcohols in alkyd resins,
qualitative/quantitative analysis, test, D 2456 (06.02)

impurities in high-purity ethylbenzene, by gas chromatography,
test, D 5060 (06.03)

monopentaerythritol in commercial pentaerythritol, test,
D 2195 (06.03)

phenol content (of tar acid mixtures), by gas liquid chromatography,
test, D 3626 (06.03)

pinene composition (of wood/gum/sulfate turpentine), test,
D 3009 (06.03)

purity analysis of isopropylbenzene (cumene), test,
D 3760 (06.03)

purity/benzene content of cyclohexane 995, by gas chromatography,
test, D 3054 (06.03)

- purity of methyl (amyl ketone/isoamyl ketone), test, D 3893 (06.03)
- purity of methyl ethyl ketone, using gas chromatography, test, D 2804 (06.03)
- purity of methyl isobutyl ketone, by gas chromatography, test, D 3329 (06.03)
- purity of propylene glycol monomethyl ether/dipropylene glycol monomethyl ether/propylene glycol monomethyl ether acetate, test, D 4773 (06.03)
- qualitative identification of polymers in emulsion paints, by infrared analysis/pyrolysis-gas liquid chromatography, practice, D 3168 (06.01)
- residual vinyl chloride monomer content of poly(vinyl chloride) resins/compounds/copolymers by solution injection technique, test, D 3680 (06.02)
- solvent composition analysis (of solvent-type paints), direct-injection technique, practice, D 3271 (06.01)
- thiophene content of refined benzene, with flame photometric detection, test, D 4735 (06.03)

 - sampling and testing dipentene, method, D 801 (06.03)
- Color—paints/related coatings/materials**
 - aluminum silicate (hydrous/anhydrous) pigment, analysis, test, D 718 (06.02)
 - artists' paints (oil/resin-oil/alkyd), spec., D 4302 (06.01)
 - benzene/toluene/xylenes/refined solvent naphthas/similar industrial aromatic hydrocarbons, test, D 848 (06.03)
 - cellulose acetate, test, D 871 (06.02)
 - clarity/cleanness of (nonpigmented) paint and ink liquids, by visual examination, test, D 2090 (06.02, 06.03)
 - clear liquids, by platinum-cobalt scale, test, D 1209 (06.01, 06.03)
 - color differences from instrumentally measured color differences of opaque materials, test, D 2244 (06.01)
 - colored pigments (dry/pastes in oil), with a mechanical miller, test, D 387 (06.02)
 - color of transparent liquids, by Gardner color scale, test, D 1544 (06.01, 06.02, 06.03)
 - color pigments, by miniature sandmill method, test, Δ D 3022 (06.02)
 - drying oils (after heating), test, D 1967 (06.03)
 - evaluation of color for thermoplastic traffic marking materials, test, D 4960 (06.01)
 - magnesium silicate pigment, analysis, test, D 717 (06.02)
 - preparation of standard color solutions (caramel/platinum-cobalt), for color test on soluble nitrocellulose-base solutions, D 365 (06.02)
 - quantifying dirt collection on coated exterior panels, test, D 3719 (06.01)
 - reflection haze (of high gloss surfaces), test, D 4039 (06.01)
 - relative tinting strength of chromatic paints, test, D 4838 (06.01)
 - sampling and testing pine tars/pine-tar oils, method, D 856 (06.03)
 - sampling and testing turpentine, method, D 233 (06.03)
 - sampling/testing lac resins (orange shellac/button lac/garnet lac/bleached lac), test, D 29 (06.02)
 - solid aromatic hydrocarbons/related materials (in molten state), by platinum-cobalt scale, test, D 1686 (06.03)
 - solution color of 4,4'-isopropylidenediphenol (dissolved in methanol), test, D 4789 (06.03)
 - testing industrial water-reducible coatings, guide, D 4712 (06.01)
- Colorfastness**
 - lightfastness of printed matter, D 3424 (06.01)
- Colorimeter**
 - relative tinting strength of printing ink dispersions, test, D 2066 (06.01)
- Color index**
 - artists' paints (oil/resin-oil/alkyd), spec., D 4302 (06.01)
- Colorless monomeric acrylate esters**
 - methyl ether of hydroquinone (MEHQ) content of colorless monomeric acrylate esters, test, D 3125 (06.03)
- Comb gages**
 - wet film thickness of organic coatings, by notched gages, practice, D 4414 (06.01)
- Commercial cyclohexane**
 - See Cyclohexane 995
- Commercial density**
 - See Density (headings)
- Commercial hexanes**
 - commercial hexanes, spec., D 1836 (06.03)
- Comparison techniques**
 - evaluating and comparing transfer conditions-laboratory conditions, test, D 5009 (06.01)
- Compatibility**
 - conducting a patch test to assess coating compatibility, practice, D 5064 (06.01)
 - factory-primed wood products with finish coatings, test, D 2830 (06.01)
- Composites—wood**
 - edge performance of composite wood products under surfactant accelerated moisture stress, test, D 2065 (06.01)
- Composition analysis—paints/related coatings/materials**
 - chemical analysis of yellow/orange/red/brown pigments containing iron/manganese, test, D 50 (06.02)
- Compressed air**
 - oil/water presence in compressed air (used for coating application/air blast cleaning/abrasive blast cleaning), D 4285 (06.01)
- Concentration (of elements)**
 - concentration of formaldehyde solutions, test, D 2194 (06.03)
- Concrete—paint applications**
 - sample preparation for qualification testing of coatings (used in nuclear power facilities), spec., D 5139 (06.01)
- Concrete—surfaces**
 - abrading concrete, practice, D 4259 (06.01)
 - acid etching concrete, practice, D 4260 (06.01)
 - capillary moisture, by plastic sheet method, test, D 4263 (06.01)
 - continuity verification of liquid/sheet linings applied to concrete substrates, practice, D 4787 (06.01)
 - making and preparing concrete/masonry panels for testing paint finishes, method, D 1734 (06.01)
 - pH of chemically cleaned/etched concrete surfaces, D 4262 (06.01)
 - surface cleaning concrete (for coating), practice, D 4258 (06.01)
 - surface cleaning concrete unit masonry (for coating), practice, D 4261 (06.01)
- Condensation**
 - water resistance of coatings, using controlled condensation, practice, D 4585 (06.01)
- Conditioning**
 - standard environments for conditioning/testing paint/varnish/lacquer/related materials, spec., D 3924 (06.01)
- Conductance and conductivity (electrical)**
 - cathodic disbonding of pipeline coatings, accelerated procedure, test, G 8 (06.01)
 - conductimetric analysis of water-soluble ionic contamination of blasting abrasives, test, D 4940 (06.01)
 - continuity verification of liquid/sheet linings applied to concrete substrates, practice, D 4787 (06.01)
 - electrical conductivity of electrocoat baths, test, D 4399 (06.01)
- Conductivity bridge/cell**
 - electrical conductivity of electrocoat baths, test, D 4399 (06.01)
- Cone-and-plate viscometers**
 - See Viscometers (headings)
 - high shear viscosity (of paints/varnishes/related products), by ICI cone/plate viscometer, test, D 4287 (06.01)
- Conformance**
 - certification of coating conformance form, D 5063 (06.01)

- Copper phthalocyanine green**
See Phthalocyanine green
- Copper powder**
chemical analysis of cuprous oxide/copper compounds, test, D 283 (06.02)
copper powder (for antifouling paints), spec., D 130 (06.03)
- Copper strip test**
detection of copper corrosion from petroleum products, test, D 130 (06.03)
copper strip tarnish test, A, D 130 (06.03)
- Copy materials/products—holographic**
water pickup of lithographic printing inks/ventilators, test, D 4942 (06.01)
laboratory mixer, test, D 4942 (06.01)
- Corn oil**
corn oil, spec., D 1842 (06.03)
- Corrosion—atmospheric testing**
evaluation of painted/coated specimens subjected to corrosive environments, method, D 1654 (06.01)
Corrosion—electrodeposited coatings
cathodic disbonding of pipeline coatings, accelerated test, G 8 (06.01)
comparative corrosion preventive characteristics of materials used for joints/couplings/fittings/patches in pipe, test, G 8 (06.01)
- Corrosion—paints/related coatings/materials**
copper corrosion of industrial aromatic hydrocarbons, test, D 849 (06.03)
detection of copper corrosion from petroleum products, test, D 130 (06.03)
copper strip tarnish test, A, D 130 (06.03)
evaluation of painted/coated specimens subjected to corrosive environments, method, D 1654 (06.01)
film corrosion resistance, test, D 2803 (06.01)
sampling and testing dipence, method, D 801 (06.03)
water resistance of coatings, using controlled atmosphere, practice, D 4585 (06.01)
- Corrosion—pipeline coatings**
cathodic disbonding of pipeline coatings, accelerated test, G 8 (06.01)
comparative corrosion preventive characteristics of materials used for joints/couplings/fittings/patches in pipe, test, G 8 (06.01)
coatings, test, G 18 (06.01)
- Corrosion—pitting/crevice**
salt spray (fog) testing, method, B 117 (06.01)
- Corrosivity**
detection of copper corrosion from petroleum products, test, D 130 (06.03)
copper strip tarnish test, A, D 130 (06.03)
- Corrugated fiberboard boxes**
abrasion resistance of printed matter, by the ga-cat method, test, D 5181 (06.01)
slive abrasion test, D 5181 (06.01)
- Cotton**
metals (iron/copper/manganese/calcium) content of cotton pulp (from wood/cotton), by atomic spectroscopy, test, D 4085 (06.02)
Cottonseed oil
Fatty acids—specifications
cottonseed oil, spec., D 1843 (06.03)
- Coulometric titration**
aromatic hydrocarbons, for bromine content, test, D 1492 (06.03)
- Coulometry**
sulfur (trace quantities) in liquid aromatic hydrocarbons, by oxidative microcoulometry, test, D 3961 (06.03)
sulfur (trace quantities) in liquid aromatic hydrocarbons, by oxidative microcoulometry, test, D 3961 (06.03)
- Couplings**
comparative corrosion preventive characteristics of materials used for joints/couplings/fittings/patches in pipe, test, G 8 (06.01)
coatings, test, G 18 (06.01)
- Copper phthalocyanine blue**
chemical analysis of (iron/copper phthalocyanine/ultramarine) blue pigments, test, D 1135 (06.02)
- Copper content**
chemical analysis of cuprous oxide/copper pigments, test, D 283 (06.02)
metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)
sampling and testing pine tars/pine-tar oils, method, D 856 (06.03)
- Copper—corrosion**
copper corrosion of industrial aromatic hydrocarbons, test, D 849 (06.03)
detection of copper corrosion from petroleum products, by copper strip tarnish test, A, D 130 (06.03)
sampling and testing dipence, method, D 801 (06.03)
- Copal content**
sampling/testing lac resins (orange shellac/buttolac/garnet lac/bleached lac), test, D 29 (06.02)
- Contrast ratio**
hiding power of paints, by reflectometry, test, A, D 2805 (06.01)
- Contractors**
coating contractor qualification (for nuclear-powered generation facilities), practice, D 4286 (06.01)
- Continuity verification**
continuity verification of liquid/sheet linings applied to concrete substrates, practice, D 4787 (06.01)
- Contamination—paints/coatings applications**
chemical resistance of pipeline coatings, test, G 20 (06.01)
conductometric analysis of water-soluble ionic contamination of blasting abrasives, test, D 4940 (06.01)
decontamination of coatings used in light-water nuclear power plants, test, D 4256 (06.01)
- Contamination—nuclear**
use of protective standards in nuclear power plants, selecting ASTM standards, guide, D 5144 (06.01)
- Contamination—phthalic anhydride**
sampling/unloading procedures—for naphthalene/maleic practice, D 3852 (06.03)
sampling/unloading procedures—for cresylic acid/phenol, practice, D 3925 (06.01)
sampling procedures—for paints/pigmented coatings, practice, D 3925 (06.01)
temperature, practice, D 3437 (06.03)
sampling/handling liquid cyclic products (at ambient temperature), practice, D 3436 (06.03)
sampling and handling aniline, practice, D 3436 (06.03)
- Containers—tank cars/wagons**
abrasion resistance of printed matter, by the ga-cat comprehensive abrasion test, D 5181 (06.01)
- Containers—fiberboard**
in aerosol cans, test, D 5200 (06.01)
- Containers—volatile organic compounds (VOC) of solvent reducible paints**
consistency of paints, using Stormer viscometer, test, D 562 (06.01)
- Consistency**
specifying inspection requirements for coating/lining work on metal substrates, guide, D 5161 (06.01)
- Consequence of coatings failure**
See Oils (headings)
- Conjugated diene**
spectrophotometric diene value of dehydrated castor oil/derivatives, test, D 1358 (06.03)
- Conical mandrel apparatus**
mandrel bend test of attached organic coatings, test, D 522 (06.01)
- Conical mandrel apparatus**
mandrel bend test of attached organic coatings, test, D 522 (06.01)

Index of ASTM Standards, Section 6

Degradation—paints/related coatings/materials

Cracking—coatings
 continuity verification of liquid/sheet linings applied to concrete substrates, practice, D 4787 (06.01)
 edge performance of composite wood products under surfactant accelerated moisture stress, test, D 2065 (06.01)
 effects of outdoor weathering on pipeline coatings, test, G 11 (06.01)
 exterior paints, evaluating, test, Δ D 661 (06.01)
 mandrel bend test of attached organic coatings, test, D 522 (06.01)
 specific bendability of pipeline coatings, test, G 10 (06.01)
resol
 water content, by iodine reagent method, test, D 1631 (06.03)
resylic acid
 and phenol, sampling and handling, practice, D 3852 (06.03)
 color of cresylic acids ("C" series standards), test, D 3627 (06.03)
 cresylic acid content (of alkaline cresylate solutions), chemical analysis, D 3439 (06.03)
 pyridine base content in cresylic acid, by direct titration, test, D 4471 (06.03)
ross-cut tape test
 adhesion of coating films to metallic substrates, by tape test, D 3359 (06.01)
ross-hatch tape test
 adhesion of coating films to metallic substrates, by tape test, D 3359 (06.01)
ross index
 index of ASTM methods equivalent/related to methods in Federal Standard 141 ("Paint, Varnish, Lacquer, and Related Materials; Methods for Sampling and Testing"), (Related Material) (06.01, 06.02, 06.03)
Crude tar acids
 See Tar acids—crude/refined
Crystallization
 solidification point of 4,4'-isopropylidenediphenol (Bisphenol A), test, D 4493 (06.03)
(T) specimen testing
 adhesion of coating films to metallic substrates, by tape test, D 3359 (06.01)
Cumene (isopropylbenzene)
 See Isopropylbenzene (cumene)
Cumene process
 analysis of major organic impurities in phenol produced by the cumene process, by gas chromatography, test, D 4961 (06.03)
Cuprous oxide
 chemical analysis of cuprous oxide/copper pigments, test, D 283 (06.02)
 cuprous oxide (for antifouling paints), spec., D 912 (06.02)
Curing characteristics
 MEK resistance of ethyl silicate (inorganic) zinc-rich primers, by solvent rub, test, D 4752 (06.01)
Curing of organic coatings
 See Drying or curing
Curing time
 stroke cure time of thermosetting phenol-formaldehyde resins, test, D 4640 (06.02)
Current measurement
 comparative corrosion preventive characteristics of materials used for joints/couplings/fittings/patches in pipeline coatings, test, G 18 (06.01)
 disbonding characteristics of pipeline coatings, by direct soil burial, test, G 19 (06.01)
Curtain coat
 testing industrial water-reducible coatings, guide, D 4712 (06.01)
Cut tape test
 adhesion of coating films to metallic substrates, by tape test, D 3359 (06.01)

Cyanoacrylate adhesive
 adhesion of organic coatings to plastic substrates, by direct tensile testing, D 5179 (06.01)
Cyclohexane
 apparent density of industrial aromatic hydrocarbons, test, D 2935 (06.03)
 benzene content of cyclic hydrocarbon products, by gas chromatography, test, D 4534 (06.03)
 commercial density (of pure liquid chemicals), test, D 3505 (06.03)
 sampling/handling liquid cyclic products (at ambient temperature), practice, D 3437 (06.03)
 trace (total) chloride (organic/inorganic) in liquid aromatic hydrocarbons, test, D 5194 (06.03)
 volume/weight of industrial aromatic hydrocarbons, method, D 1555 (06.03)
Cyclohexane 995
 cyclohexane 995, spec., D 3055 (06.03)
 purity/benzene content of cyclohexane 995, by gas chromatography, test, D 3054 (06.03)
Cylindrical mandrel apparatus
 mandrel bend test of attached organic coatings, test, D 522 (06.01)

D

Damping hardness test
 hardness of organic coatings, by König/Perseoz pendulum hardness tests, D 4366 (06.01)
Dark chrome yellow
 See Chrome yellow and orange
Data analysis—recording/reporting results
 recording results on single-/multi-panel forms, method, Δ D 1150 (06.01)
Daylight
 See Reflectance and reflectivity (headings)
 directional reflectance factor (45-deg 0-deg) of opaque specimens, by broad-band filter reflectometry, test, E 97 (06.01)
Decomposition points
 industrial aromatic hydrocarbons, in distillation tests, D 850 (06.03)
Decontamination
 decontaminability of coatings used in light-water nuclear power plants, test, D 4256 (06.01)
 use of protective coating standards in nuclear power plants, selecting ASTM standards, guide, D 5144 (06.01)
Defects—coatings
 photographic documentation of coatings/lining defects and failures, D 4121 (06.01)
 reporting paint film failures characteristic of exterior latex paints, classification, D 1848 (06.01)
Definition of terms
 naval stores/related products, def. of terms, D 804 (06.03)
 protective coating/lining work for power generation facilities, terminology, D 4538 (06.01)
Deformation—paints/related coatings/materials
 flexibility/adhesion of organic coatings (paints) on preprinted deformed metallic sheets, test, D 4145 (06.01)
 formability/adhesion of zinc-rich primer/chromate complex coatings (on steel), test, D 4146 (06.01)
 mar resistance of organic coatings, using balanced beam scrape adhesion and mar test, D 5178 (06.01)
 penetration resistance of pipeline coatings, by blunt rod test, G 17 (06.01)
 resistance of organic coatings to effects of rapid deformation (impact), test, D 2794 (06.01)
Degradation—paints/related coatings/materials
 accelerated outdoor exposure tests of coatings (applied to metal substrates), practice, D 4141 (06.01)

Index of ASTM Standards, Section 6

Degradation—paints/related coatings/materials

- conducting tests on paint/varnish/lacquer/related products, using enclosed carbon-arc light/water exposure apparatus, practice, D 5031 (06.01)
- exposure of paints/related coatings to fluorescent UV-condensation light-water-exposure apparatus, practice for conducting tests, D 4587 (06.01)
- water resistance of coatings, using controlled condensation, practice, D 4585 (06.01)

Degree of cure

See Curing characteristics

Degree of dispersion

See Dispersion

Degree of settling

evaluating degree of settling (pigment suspension/ease of remixing a shelf-aged sample) of paint, test, D 869 (06.01)

Degrees of freedom

aromatic hydrocarbons/related chemicals, terminology, D 4790 (06.03)

Degummed soybean oil

See Soybean oil

Dehydrated castor oil

See Castor oil

Densitometer

relative tinting strength of printing ink dispersions, test, D 2066 (06.01)

Density—paints/related coatings/materials

apparent density of industrial aromatic hydrocarbons, test, D 2935 (06.03)

aromatic hydrocarbons/related chemicals, terminology, D 4790 (06.03)

calculating formulation physical constants of paints/coatings, practice, D 5201 (06.01)

commercial density (of pure liquid chemicals), test, D 3505 (06.03)

hydrogen sulfide/sulfur dioxide (qualitative) of industrial aromatic hydrocarbons, test, D 2363 (06.02)

hydroxyethylcellulose, test, D 2364 (06.02)

methylcellulose, test, D 1347 (06.02)

paint/varnish/lacquer/related products, test, Δ D 1475 (06.01)

sodium glycolate content of sodium carboxymethylcellulose, test, D 1439 (06.02)

volume/weight of industrial aromatic hydrocarbons, method, D 1555 (06.03)

Density—petroleum products

volume/weight of industrial aromatic hydrocarbons, method, D 1555 (06.03)

Dental tin foil substrate

preparation of free films of organic coatings, practice, D 4708 (06.01)

Deposition

deposition efficiency of polymeric powders/powder coatings, practice, D 3451 (06.01)

Depth of color

See Color (headings)

Depth of penetration

penetration resistance of pipeline coatings, by blunt rod test, G 17 (06.01)

Design—building applications

design/fabrication of flue gas desulfurization system components (for protective lining application), spec., D 4618 (06.01)

Design basis accident (DBA)

use of protective coating standards in nuclear power plants, selecting ASTM standards, guide, D 5144 (06.01)

Destructively-distilled wood turpentine

See Turpentine

Destructive testing—coatings

dry film thickness of protective coating systems, by destructive means, test, D 4138 (06.01)

Desulfurization systems

design/fabrication of flue gas desulfurization system components (for protective lining application), spec., D 4618 (06.01)

inspection of linings in operating flue gas desulfurization systems, practice, D 4619 (06.01)

Detergent materials/systems—drycleaning

mineral (petroleum) spirits hydrocarbon drycleaning solvent, spec., D 235 (06.03)

Detergent resistance

organic finishes, practice, D 2248 (06.01)

Deterioration

water penetration into pipeline coatings, test, G 9 (06.01)

Deterioration—biodegradation

microbiological discoloration (of paint film surfaces), exposure tests, practice, D 3456 (06.01)

paint films, evaluating degree of surface discoloration, Δ D 3274 (06.01)

resistance of emulsion paints (in containers) to attack by microorganisms, test, D 2574 (06.01)

resistance to mold growth on surface of interior paint/coatings (in an environmental chamber), test, D 3273 (06.01)

Dew cycle

operating light- and water-exposure apparatus (unbuffered carbon-arc type), in testing paints and related coatings, practice, D 3361 (06.01)

Diacetone alcohol

diacetone alcohol, spec., D 2627 (06.03)

Diamines

See Fatty diamines

Diatomaceous silica pigment

See Silica (diatomaceous)

diatomaceous silica pigment, analysis, test, D 719 (06.02)

Dibasic acids (absence or presence)

See Phthalic anhydride content

Dibenzal method

monopentaerythritol in commercial pentaerythritol, test, D 2195 (06.03)

Dibutyl phthalate

dibutyl phthalate, spec., D 608 (06.03)

Dichloromethane

dichloromethane/1,1,1-trichloroethane content in paints/coatings, by direct injection gas chromatography, test, D 4457 (06.01)

dichloromethane-soluble matter content of cellulose, test, D 3971 (06.02)

Dielectric constant (permittivity)/dissipation factor

comparative corrosion preventive characteristics of materials used for joints/couplings/fittings/patches in pipeline coatings, test, G 18 (06.01)

water penetration into pipeline coatings, test, G 9 (06.01)

Diethylbenzene isomers

impurities in high-purity ethylbenzene, by gas chromatography, test, D 5060 (06.03)

Diethylene glycol

diethylene glycol, spec., D 2694 (06.03)

flash/fire point of liquids, by Tag open-cup apparatus, test, D 1310 (06.03)

Difatty secondary amines

See Fatty amines

Differences in color

See Color (headings)

Diffraction intensity (of x-rays)

See X-ray diffraction

Dillon dynamometer

bond strength of thermoplastic traffic marking materials, using cement bricks/steel cubes, test, D 4796 (06.01)

Diluents

paint/related coatings-odor (characteristic/residual), test, D 1296 (06.03)

- Dilutability value**
resin solution dilutability, test, D 5062 (06.03)
- Dilution ratio/value**
cellulose nitrate solutions, for active solvents, hydrocarbon diluents, and cellulose nitrates, test, D 1720 (06.03)
soluble cellulose nitrate, testing, methods, D 301 (06.02)
- Dimer**
acrylic acid dimer in acrylic acid/unsaturated organic acids, test, D 4415 (06.03)
- Dimethyl-benzyl alcohol**
analysis of major organic impurities in phenol produced by the cumene process, by gas chromatography, test, D 4961 (06.03)
- Dimethyl ketone**
See Acetone
- Dip application**
testing industrial water-reducible coatings, guide, D 4712 (06.01)
- Dip coater**
producing films of uniform thickness of paint/varnish/related products on test panels, test, D 823 (06.01)
- Dipentene (and related terpene solvents)**
sampling and testing dipentene, method, D 801 (06.03)
- Dipropylene glycol**
dipropylene glycol, spec., D 2696 (06.03)
propylene glycol/dipropylene glycol, spec., D 5164 (06.03)
- Dipropylene glycol monomethyl ether (DPM)**
dipropylene glycol monomethyl ether, spec., D 4836 (06.03)
purity of propylene glycol monomethyl ether/dipropylene glycol monomethyl ether/propylene glycol monomethyl ether acetate, test, D 4773 (06.03)
- Dip-type viscosity test**
viscosity (of paints/varnishes/lacquers/related materials), by dip-type viscosity cups, test, D 4212 (06.01)
- Direct aspiration spectrophotometric procedure**
See Spectrophotometry (headings)
lead content in paint, by direct aspiration atomic absorption spectroscopy, test, D 4834 (06.01)
- Directionality**
gloss of high-gloss metallic/nonmetallic surfaces, by goniophotometry, method, E 430 (06.01)
- Directionality of surface**
gloss differences between surfaces of similar appearance, method for visual evaluation, D 4449 (06.01)
- Directional reflectance**
See Reflectance and reflectivity (headings)
- Dirt accumulation**
See Soil accumulation
quantifying dirt collection on coated exterior panels, test, D 3719 (06.01)
- Dirt resistance**
See Resistance—soil
- Disbonding**
disbonding characteristics of pipeline coatings, by direct soil burial, test, G 19 (06.01)
specific bendability of pipeline coatings, test, G 10 (06.01)
- Disbonding—cathodic**
cathodic disbonding of pipeline coatings, accelerated procedure, test, G 8 (06.01)
pipeline coatings subjected to high or cyclic temperatures, test, G 42 (06.01)
- Discoloration**
See Color—discoloration
- Discontinuities—coatings**
continuity verification of liquid/sheet linings applied to concrete substrates, practice, D 4787 (06.01)
discontinuity (holiday) testing of nonconductive protective coating on metallic substrates, practice, D 5162 (06.01)
- Dispersion**
coarse particles in pigments/pastes/paints, test, D 185 (06.01, 06.02)
- copper phthalocyanine blue pigment, spec., D 963 (06.02)
fineness of grind of printing inks, by NPIRI grindometer, test, D 1316 (06.01)
- Distillation—bituminous materials**
water in petroleum products/bituminous materials, by distillation, test, D 95 (06.01, 06.03)
- Distillation—paints/related coatings/materials**
cresylic acid content (of alkaline cresylate solutions), chemical analysis, D 3439 (06.03)
distillation of industrial aromatic hydrocarbons/related materials, test, D 850 (06.03)
distillation of petroleum products, method, D 86 (06.03)
distillation range (between 30 and 350°C) of volatile organic liquids, test, D 1078 (06.03)
ethyl acetate (all grades), spec., D 4614 (06.03)
pine tars and pine tar oils, test, D 856 (06.03)
sampling and testing dipentene, method, D 801 (06.03)
sampling and testing pine oil, method, D 802 (06.03)
sampling and testing turpentine, method, D 233 (06.03)
vacuum distillation (for vehicle separation in solvent-type paints), practice, D 3272 (06.01)
- Distillation—petroleum products**
distillation of petroleum products, method, D 86 (06.03)
water in petroleum products/bituminous materials, by distillation, test, D 95 (06.01, 06.03)
- Distilled fatty acids**
See Fatty acids—specifications
- Distilled water**
acidity of benzene/toluene/xylenes/solvent naphthas/similar industrial aromatic hydrocarbons, test, D 847 (06.03)
- Doctor test**
mineral (petroleum) spirits hydrocarbon drycleaning solvent, spec., D 235 (06.03)
- Dolomite**
See Calcium carbonate
- Double rub method**
MEK resistance of ethyl silicate (inorganic) zinc-rich primers, by solvent rub, test, D 4752 (06.01)
- Douglas fir**
wood used as panels in weathering tests of coatings, spec., D 358 (06.01)
- Draft test**
varnish films, test, D 1643 (06.01)
- Drag**
comparison of the brush drag of latex paints, test, D 4958 (06.01)
- Drawdowns**
preparing drawdowns of artists' paste paints, practice, D 4941 (06.01)
- Draw-down test**
coil coatings, application using a wire-wound drawdown bar, practice, D 4147 (06.01)
leveling characteristics of architectural paints/coatings (aqueous/nonaqueous), in white/light tints, D 4062 (06.01)
paint spatter resistance to roller application, test, D 4707 (06.01)
sag resistance of paints, using a multinotch applicator, test, D 4400 (06.01)
- Driers**
calcium/zinc content, by EDTA method, test, D 2613 (06.03)
cerium content, by EDTA method, test, D 3970 (06.03)
clarity/cleanliness of (nonpigmented) paint and ink liquids, by visual examination, test, D 2090 (06.02, 06.03)
cobalt content, by EDTA method, test, D 2373 (06.03)
iron in liquid iron paint driers, by EDTA method, test, D 3804 (06.03)
lead content, by EDTA method, test, D 2374 (06.03)
liquid paint driers, selection of test methods, D 564 (06.03)
liquid paint driers, spec., D 600 (06.03)
manganese content, by EDTA method, test, D 2375 (06.03)
rare earths content, by EDTA method, test, D 3989 (06.03)

Index of ASTM Standards, Section 6

Driers

- vanadium content, by EDTA method, test, D 3988 (06.03)
- volatile/nonvolatile content (of driers/drying oils/naval stores and solvents), selecting test procedures, guide, D 4140 (06.03)
- zirconium content, by EDTA method, test, D 3969 (06.03)
- Drop black**
 - See Bone black
- Drop tests**
 - impact resistance of pipeline coatings, by limestone drop test, G 13 (06.01)
- Dry bleached lac**
 - See Bleached lac
- Dry film thickness**
 - See Film—dry film thickness
- Drying oils**
 - See Oils—drying
- Drying or curing**
 - coatings, by ultra-violet techniques, practice for reporting cure time, D 3732 (06.01)
 - MEK resistance of ethyl silicate (inorganic) zinc-rich primers, by solvent rub, test, D 4752 (06.01)
 - organic coatings, at room temperature, determination of film formation rates, test, D 1640 (06.01)
 - sampling and testing shellac varnish, D 1650 (06.02)
 - soluble cellulose nitrate, testing, methods, D 301 (06.02)
 - temperature of applied coatings on wood products during the curing cycle, by infrared radiation thermometers, practice, D 3259 (06.01)
- Drying time**
 - sampling and testing shellac varnish, D 1650 (06.02)
- Dry red lead**
 - See Red lead
- Durability**
 - accelerated outdoor exposure tests of coatings (applied to metal substrates), practice, D 4141 (06.01)
 - comparison of the brush drag of latex paints, test, D 4958 (06.01)
 - exterior durability (of varnishes), test, D 1641 (06.01)
 - factory-primed wood products with finish coatings, test, D 2830 (06.01)
- Dutch white**
 - See Basic carbonate white lead
- Dynamic viscosity**
 - See Viscosity (headings)
- Dynamometer testing**
 - bond strength of thermoplastic traffic marking materials, using cement bricks/steel cubes, test, D 4796 (06.01)

E

- Earth pigments**
 - See Ochre
 - See Sienna (burnt and raw)
 - See Umber (burnt and raw)
- Ease of brushing**
 - comparison of the brush drag of latex paints, test, D 4958 (06.01)
- Eccentric center wheel wet film thickness gage**
 - wet film thickness of organic coatings, D 1212 (06.01)
- Eddy current examination**
 - See Electromagnetic (eddy current) testing
- Edge performance**
 - edge performance of composite wood products under surfactant accelerated moisture stress, test, D 2065 (06.01)
- EDTA method**
 - calcium content in paint driers, test, D 2613 (06.03)
 - cobalt content in paint driers, test, D 2373 (06.03)
 - iron content in paint driers, test, D 3804 (06.03)
 - lead content in paint driers, test, D 2374 (06.03)
 - manganese content in paint driers, test, D 2375 (06.03)

- rare earths content (of paint driers), test, D 3988 (06.03)
- vanadium content in paint driers, test, D 3988 (06.03)
- zinc content in paint driers, test, D 2613 (06.03)
- zirconium content in paint driers, test, D 3969 (06.03)
- Efflorescence**
 - interior coatings (of water-base paints), test, D 1848 (06.01)
 - reporting paint film failures characteristic of exterior paints, classification, D 1848 (06.01)
- Efflux cups**
 - viscosity of paints/related materials, by ISO flow cups, test, D 5125 (06.03)
- Elasticity**
 - elasticity/toughness of varnishes, test, D 1642 (06.01)
- Electrical insulating solids**
 - orange shellac/other indian lacs for electrical insulation, test, D 784 (06.02)
 - shellac (dry/powdered) used for electrical insulation, test methods, D 411 (06.02)
- Electrical measurements—coating applications**
 - cathodic disbonding of pipeline coatings, accelerated procedure, test, G 8 (06.01)
 - comparative corrosion preventive characteristics of coatings used for joints/couplings/fittings/patches in pipeline coatings, test, G 18 (06.01)
 - disbonding characteristics of pipeline coatings, by immersion, test, G 19 (06.01)
 - discontinuity (holiday) testing of nonconductive pipe coating on metallic substrates, practice, D 5162 (06.01)
 - effects of outdoor weathering on pipeline coatings, test, G 11 (06.01)
 - impact resistance of pipeline coatings, by falling weight, test, G 14 (06.01)
 - impact resistance of pipeline coatings, by limestone drop test, G 13 (06.01)
 - water penetration into pipeline coatings, test, G 9 (06.01)
- Electrical stress**
 - cathodic disbonding of pipeline coatings, accelerated procedure, test, G 8 (06.01)
- Electrochemical measurements**
 - nitrobenzene in aniline, test, D 4589 (06.03)
- Electrocoat baths**
 - acid/base milliequivalent content of (anodic/cathodic) electrocoat baths/their ultrafiltrates, test, D 4370 (06.01)
 - analysis of electrocoat bath samples, guide, D 1978 (06.01)
 - apparent pH of electrocoat baths, test, D 4584 (06.01)
 - electrical conductivity of electrocoat baths, test, D 4390 (06.01)
 - nonvolatile and pigment content of electrocoat baths, using muffle furnace, test, D 5145 (06.01)
- Electrostatic spray**
 - evaluating and comparing transfer conditions-laboratory conditions, test, D 5009 (06.01)
- Electrostatic spray application**
 - testing industrial water-reducible coatings, guide, D 4712 (06.01)
- Elongation**
 - mandrel bend test of attached organic coatings, test, D 522 (06.01)
- Elongation—attached organic coatings**
 - elongation/tensile strength/stiffness, test, D 2370 (06.01)
- Emergent stem temperature corrections**
 - distillation of industrial aromatic hydrocarbons, test, D 850 (06.03)
- Emulsion vehicles (for paints/related coatings)**
 - blocking resistance of trade sales paints, test, D 4946 (06.01)
 - freeze-thaw resistance of water-borne coatings, test, D 2243 (06.01)
 - minimum film formation temperature (MFFT) of emulsion vehicles, test, D 2354 (06.02)

Index of ASTM Standards, Section 6

Exposure tests—carbon-arc apparatus

testing industrial water-reducible coatings, guide, D 4712 (06.01)
 volatile/nonvolatile content (of cellulose/ emulsions/ resin solutions/ shellac/ varnishes), selecting test procedures, practice, D 4209 (06.02)
Enamel coatings
 See Coatings—enamel
English china clay
 See Aluminum silicate
Epoxy equivalent weight (EEW)
 epoxy content of epoxy resins, test, D 1652 (06.02)
Epoxy content
 epoxy resins, selecting test procedures, practice, D 4142 (06.02)
Epoxy (EP) plastics—coatings
 subjecting marine antifouling coating to bifouling and fluid shear forces in natural seawater, test, D 4939 (06.01)
Epoxy resins
 selecting test procedures, practice, D 4142 (06.02)
Equilibrium method
 flash point of liquids, test, D 3941 (06.03)
Erosion
 erosion testing of antifouling paints, using high velocity water, test, D 4938 (06.01)
 exterior paints, method for evaluating, Δ D 662 (06.01)
 practical washability of organic coatings, test, D 4828 (06.01)
 wet abrasion resistance of interior paints to scrubbing, by weight loss, test, D 4213 (06.01)
Ester content
 alcohol content/purity of acetate esters, by gas chromatography, test, D 3545 (06.03)
Esters
 n-butyl acetate (all grades), spec., D 4615 (06.03)
 ester value of solvents and thinners, test, D 1617 (06.03)
 ethyl acetate (all grades), spec., D 4614 (06.03)
 hexyl acetate, spec., D 5137 (06.03)
 hydroxyl content of pyridine-soluble esters, by spectrophotometry, test, Δ D 817 (06.02)
 isobutyl acetate (95 % grade), spec., D 1718 (06.03)
 n-propyl acetate (96 % grade), spec., D 3130 (06.03)
 phthalic anhydride content- in presence of dibasic acids, by gravimetric test, D 1306 (06.02)
 primary (synthetic) amyl acetate (98 % grade), spec., D 3540 (06.03)
Ester value
 ester value of solvents and thinners, test, D 1617 (06.03)
Etching
 acid etching concrete, practice, D 4260 (06.01)
Etherification
 sodium glycolate content of sodium carboxymethylcellulose, test, D 1439 (06.02)
Ethoxy ethanol
 2-ethoxyethanol, spec., D 331 (06.03)
Ethoxyethyl acetate
 2-ethoxyethyl acetate (99 % grade), spec., D 3728 (06.03)
 alcohol content/purity of acetate esters, by gas chromatography, test, D 3545 (06.03)
Ethoxyl content
 ethylcellulose, test, D 914 (06.02)
Ethoxyl substitution
 ethoxyl substitution in cellulose ether products, by gas chromatography, test, D 4794 (06.02)
Ethyl acetate
 alcohol content/purity of acetate esters, by gas chromatography, test, D 3545 (06.03)
 ethyl acetate (all grades), spec., D 4614 (06.03)
Ethyl acrylate
 ethyl acrylate (98.5 % grade), spec., D 3548 (06.03)
 purity, by gas chromatography, test, D 3362 (06.03)

Ethylbenzene
 aromatics (ethylbenzene and eight-carbon (C₈/heavier) content in mineral spirits, by gas chromatography, test, D 3257 (06.03)
 ethylbenzene, spec., D 3193 (06.03)
 impurities in high-purity ethylbenzene, by gas chromatography, test, D 5060 (06.03)
 purity of hydrocarbons from freezing points, test, D 1016 (06.03)
 sampling/handling liquid cyclic products (at ambient temperature), practice, D 3437 (06.03)
 trace (total) chloride (organic/inorganic) in liquid aromatic hydrocarbons, test, D 5194 (06.03)
Ethylcellulose
 ethylcellulose, methods of testing, D 914 (06.02)
Ethylenediamine tetraacetate (EDTA) content
 See EDTA method
Ethylene glycol
 ethylene glycol, spec., D 2693 (06.03)
 glycerol/ethylene glycol/pentaerythritol in alkyd resins, test, D 1615 (06.02)
Ethylene glycol monobutyl ether
 See Butoxyethanol
Ethylene glycol monoethyl ether
 See Ethoxy ethanol
Ethylene glycol monomethyl ether
 See Methoxy ethanol
2-Ethylhexanol
 2-ethylhexanol (synthetic), spec., D 1969 (06.03)
 ethyl methyl pentanol content/purity value of 2-ethylhexanol, by gas chromatography, test, D 5008 (06.03)
2-Ethylhexyl acrylate
 2-ethylhexyl acrylate, spec., D 3541 (06.03)
Ethyl iodide
 ethoxyl substitution in cellulose ether products, by gas chromatography, test, D 4794 (06.02)
Ethyl methyl pentanol content
 ethyl methyl pentanol content/purity value of 2-ethylhexanol, by gas chromatography, test, D 5008 (06.03)
Ethyl silicate (inorganic) primer
 Sa Primer
 MEK resistance of ethyl silicate (inorganic) zinc-rich primers, by solvent rub, test, D 4752 (06.01)
Evaporation—rate/time
 volatile liquids with low viscosity, test, D 3539 (06.01)
Exempted solvents
 Sa Solvents (headings)
 dichloromethane/1,1,1-trichloroethane content in paints/coatings, by direct injection gas chromatography, test, D 4457 (06.01)
Expected flash point
 See Flash point (headings)
Exposure—personnel
 design/use of safety alert system for hazardous work locations in coating/lining industry, practice, Δ D 4257 (06.01)
Exposure tests
 freeze-thaw resistance of water-borne coatings, test, D 2243 (06.01)
 testing water resistance of coatings at 100 % relative humidity, practice, D 2247 (06.01)
 water resistance of coatings, using controlled condensation, practice, D 4585 (06.01)
Exposure tests—carbon-arc apparatus
 accelerated testing of paints/varnishes/lacquers/related products, using filtered open flame carbon-arc light/water exposure apparatus, practice, D 822 (06.01)
 carbon-arc light- and water-exposure apparatus, unfiltered, by Dew cycle, practice for operating, D 3361 (06.01)

Index of ASTM Standards, Section 6

Exposure tests—carbon-arc apparatus

- conducting tests on paint/varnish/lacquer/related products, using enclosed carbon-arc light/water exposure apparatus, practice, D 5031 (06.01)
- operating carbon-arc light-exposure apparatus with and without water for exposure of nonmetallic materials, practice, G 23 (06.01)

Exposure tests—corrosive environments

- evaluating filiform corrosion resistance of organic coatings on metal, test, D 2803 (06.01)
- evaluation of painted/coated specimens subjected to corrosive environments, method, D 1654 (06.01)

Exposure tests—exterior

- accelerated outdoor exposure tests of coatings (applied to metal substrates), practice, D 4141 (06.01)
- conducting exterior exposure tests of (exterior) paints on steel, test, D 1014 (06.01)
- conducting exterior exposure tests of house/trim paints on new/unpainted wood, practice, D 1006 (06.01)
- effects of outdoor weathering on pipeline coatings, test, G 11 (06.01)
- quantifying dirt collection on coated exterior panels, test, D 3719 (06.01)
- testing industrial water-reducible coatings, guide, D 4712 (06.01)

Exposure tests—fluorescent-UV apparatus

- exposure of paints/related coatings to fluorescent UV-condensation light-water-exposure apparatus, practice for conducting tests, D 4587 (06.01)
- operating light-/water-exposure apparatus (fluorescent-UV condensation type) for exposure of nonmetallic materials, practice, G 53 (06.01)

Exposure tests—light

- accelerated testing of paints/varnishes/lacquers/related products, using filtered open flame carbon-arc light/water exposure apparatus, practice, D 822 (06.01)
- conducting tests on paint/varnish/lacquer/related products, using enclosed carbon-arc light/water exposure apparatus, practice, D 5031 (06.01)
- lightfastness of pigments (in artists' paints), test, D 4303 (06.01)
- lightfastness of printed matter, D 3424 (06.01)
- operating light-exposure apparatus (xenon-arc type) with/without water for exposure of nonmetallic materials, practice, G 26 (06.01)
- operating light-/water-exposure apparatus (fluorescent-UV condensation type) for exposure of nonmetallic materials, practice, G 53 (06.01)

Exposure tests—organic coatings

- detergent-resistance, practice, D 2248 (06.01)
- effect of chemical agents on organic finishes (used in transportation industry), practice, D 1540 (06.01)
- effects of overbaking on organic coatings, practice, D 2454 (06.01)
- evaluating filiform corrosion resistance, test, D 2803 (06.01)
- evaluating (interior/exterior) coatings for protecting steel surfaces at high-temperature service, test, D 2485 (06.01)
- evaluation of painted/coated specimens subjected to corrosive environments, method, D 1654 (06.01)
- recording results on single- and multi-panel forms, standard, D 1150 (06.01)
- resistance to mold growth on surface of interior paint coatings (in an environmental chamber), test, D 3273 (06.01)
- testing finishes on primed metallic substrates for humidity-thermal cycle cracking, D 2246 (06.01)
- testing water resistance of coatings at 100 % relative humidity, practice, D 2247 (06.01)
- testing water resistance of coatings, using water fog apparatus, practice, D 1735 (06.01)
- water resistance of coatings on steel, using water immersion, practice, D 870 (06.01)
- wood used as panels in weathering tests of coatings, spec., D 358 (06.01)

Exposure tests—ultraviolet-cured coatings

- cure time, practice for reporting, D 3732 (06.01)
- estimating package stability of coatings for ultraviolet-curing test, D 4144 (06.01)

Exposure tests—water

- erosion testing of antifouling paints, using high-velocity water test, D 4938 (06.01)
- subjecting marine antifouling coating to biofouling and shear forces in natural seawater, test, D 4939 (06.01)

Exposure tests—xenon-arc apparatus

- operating light-exposure apparatus (xenon-arc type) with/without water for exposure of nonmetallic materials, practice, G 26 (06.01)

Extender pigments

- Sq. Aluminum silicate/Barium sulfate/Calcium carbonate/Calcium sulfate
- Magnesium silicate
- Pigments (general properties)
- Silica (diatomaceous)

- particle size distribution, by hydrometer of common extender pigments, test, D 3360 (06.02)
- yellow/orange/green pigments containing lead chromate/chromium oxide green, analysis, test, D 126 (06.02)

Exterior durability

See Durability

Exterior paints/coatings

- conducting exterior exposure tests of house/trim paints on new/unpainted wood, practice, D 1006 (06.01)
- degree of checking, evaluation, test, D 660 (06.01)
- degree of cracking, evaluation, test, D 661 (06.01)
- degree of erosion, evaluation, D 662 (06.01)
- degree of flaking, evaluation, D 772 (06.01)
- house and trim coatings, solvent-based, practices selecting/using test procedures, practice, D 2932 (06.01)
- latex house paints, selecting/using test procedures, practice, D 3129 (06.01)
- quantifying dirt collection on coated exterior panels, test, D 3719 (06.01)
- reporting paint film failures characteristic of exterior paints, classification, D 1848 (06.01)
- testing solvent-borne architectural (interior/exterior) paints, guide, D 5146 (06.01)
- testing water resistance of coatings at 100 % relative humidity, practice, D 2247 (06.01)

Extraction methods

- unsaponifiable matter content of rosin, test, D 1065 (06.01)

Extractives content

- dichloromethane-soluble matter content of cellulose, test, D 3971 (06.02)

F

Fabrication

- design/fabrication of flue gas desulfurization systems (for protective lining application), spec., D 4618 (06.01)
- profile of abrasive blast-cleaned steel surfaces, in laboratory field/fabricating shop, test, D 4417 (06.01)

Face glazing and bedding compounds—metal sash

- slump of face glazing/bedding compounds on metal sash, test, D 2376 (06.01)

Factory-applied organic coatings

See Organic coatings

Failure end point

- photographic documentation of coatings/linings defects and failures, D 4121 (06.01)
- pull-off strength of coatings, using portable adhesion tester, test, D 4541 (06.01)
- reporting paint film failures characteristic of exterior paints, classification, D 1848 (06.01)

- falling rod viscometer
viscosity of printing inks/vehicles, by falling-rod viscometer, test, D 4040 (06.01)
- falling sand abrasion test
abrasion resistance of organic coatings, by falling abrasive, test, D 968 (06.01)
- falling stones
impact resistance of pipeline coatings, by limestone drop test, G 13 (06.01)
- falling weight test
impact resistance of pipeline coatings, by falling weight test, G 14 (06.01)
- fan coat
testing industrial water-reducible coatings, guide, D 4712 (06.01)
- Fatty acids—general**
fatty acid composition, by gas-liquid chromatography of methyl esters, test, D 1983 (06.03)
fatty acids used in protective coatings—terminology and selecting test methods, guide, D 1467 (06.03)
identification of oils and oil acids in solvent-reducible paints, test, D 2245 (06.03)
preparation of methyl esters from fatty acids, for fatty acid composition analysis, test, D 3457 (06.03)
sampling liquid oils/fatty acids (commonly used in paints/varnishes/related materials), test, D 1466 (06.03)
- Fatty acids—specifications**
coconut oil, spec., D 1841 (06.03)
corn oil, spec., D 1842 (06.03)
cottonseed oil, spec., D 1843 (06.03)
dehydrated castor oil, spec., D 1539 (06.03)
linseed oil, spec., D 1538 (06.03)
soybean oil, spec., D 1537 (06.03)
tall oil, spec., D 1984 (06.03)
- Fatty acids—tests**
acid value of fatty acids/polymerized fatty acids, test, D 1980 (06.03)
ash content, test, D 1951 (06.03)
clarity/cleanliness of (nonpigmented) paint and ink liquids, by visual examination, test, D 2090 (06.02, 06.03)
color after heating, test, D 1981 (06.03)
color of transparent liquids, by Gardner color scale, test, D 1544 (06.01, 06.02, 06.03)
fatty acids used in protective coatings—terminology and selecting test methods, guide, D 1467 (06.03)
fish oil content, by gas-liquid chromatography, test, D 3725 (06.03)
hydroxyl value of fatty oils/acids, test, D 1957 (06.03)
iodine value, test, D 1959 (06.03)
polymerized fatty acids, selecting test methods, D 2575 (06.03)
rosin acid content, test, D 1240 (06.03)
saponification value of drying oils/fatty acids/polymerized fatty acids, test, D 1962 (06.03)
solidification (titer) point of fatty acids, test, D 1982 (06.03)
specific gravity at 25/25°C, test, D 1963 (06.03)
unsaponifiable matter in drying oils/fatty acids/polymerized fatty acids, test, D 1965 (06.03)
- Fatty acids content**
alkyd resins and alkyd resin solutions, test, D 1398 (06.02)
fatty acid composition, by gas-liquid chromatography of methyl esters, test, D 1983 (06.03)
oleic acid content of tall oil rosin, test, D 1585 (06.03)
preparation of methyl esters from fatty acids, for fatty acid composition analysis, test, D 3457 (06.03)
tall oil, methods of testing, D 803 (06.03)
- Fatty amidoamines**
fatty nitrogen compounds, selection of test methods, D 2071 (06.03)
iodine value, by Wijs procedure, test, D 2075 (06.03)
total/primary/secondary/tertiary amine values of fatty amines/amidoamines/diamines, by referee potentiometric method, test, D 2073 (06.03)
water content, test, D 2072 (06.03)
- Fatty amines**
fatty nitrogen compounds, selection of test methods, D 2071 (06.03)
iodine value, by Wijs procedure, test, D 2075 (06.03)
non-amine component content of fatty amines/nonamines, test, D 2082 (06.03)
percent of amines (primary/secondary/tertiary) in fatty amines, test, D 2083 (06.03)
total/primary/secondary/tertiary amine values of fatty amines/amidoamines/diamines, by referee potentiometric method, test, D 2073 (06.03)
total/primary/secondary/tertiary amine values of fatty amines, by alternative indicator method, test, D 2074 (06.03)
water content, test, D 2072 (06.03)
- Fatty diamines**
fatty nitrogen compounds, selection of test methods, D 2071 (06.03)
iodine value, by Wijs procedure, test, D 2075 (06.03)
non-amine component content of fatty amines/nonamines, test, D 2082 (06.03)
total/primary/secondary/tertiary amine values of fatty amines/amidoamines/diamines, by referee potentiometric method, test, D 2073 (06.03)
water content, test, D 2072 (06.03)
- Fatty matter content**
sampling/testing flaked aluminum powders/pastes, methods, D 480 (06.03)
- Fatty nitrogen compounds**
identification of oils and oil acids in solvent-reducible paints, test, D 2245 (06.03)
non-amine component content of fatty amines/nonamines, test, D 2082 (06.03)
selection of test methods, D 2071 (06.03)
water content, test, D 2072 (06.03)
- Fatty quaternary ammonium chlorides**
acid/amine value of fatty quaternary ammonium chlorides, test, D 2076 (06.03)
ash content, test, D 2077 (06.03)
average molecular weight determination, test, D 2080 (06.03)
fatty nitrogen compounds, selection of test methods, D 2071 (06.03)
iodine value, test, D 2078 (06.03)
nonvolatile matter (solids) content, test, D 2079 (06.03)
pH, test, D 2081 (06.03)
water content, test, D 2072 (06.03)
- Federal Standards**
index of ASTM methods equivalent/related to methods in Federal Standard 141 ("Paint, Varnish, Lacquer, and Related Materials; Methods for Sampling and Testing"), (Related Material) (06.01, 06.02, 06.03)
- Feedstock**
xylenes for *p*-xylene feedstock, spec., D 5211 (06.03)
- Ferric chloride**
methylol group determination (qualitative) in phenolic resins, test, D 4706 (06.02)
- Ferric oxide**
See Iron oxide pigments
ferric oxide in barium sulfate pigment, test, D 715 (06.02)
- Ferrite pigments**
See Iron oxide black
- Ferrous iron content**
iron oxide black (natural)- chemical analysis, test, D 3872 (06.02)
- Ferrous sulfate titration**
nitrogen content of soluble nitrocellulose, by ferrous sulfate procedure, test, D 4795 (06.02)
- Fiber-optic light**
See Light—transmission and reflection

Fibrous magnesium silicate**Fibrous magnesium silicate***See* Magnesium silicate**Field testing—paints/related coatings/materials**

assessing the condition of aged coatings on steel surfaces, guide, D 5065 (06.01)

conductometric analysis of water-soluble ionic contamination of blasting abrasives, test, D 4940 (06.01)

conducting a patch test to assess coating compatibility, practice, D 5064 (06.01)

field identification of coatings, test, D 5043 (06.01)

profile of abrasive blast-cleaned steel surfaces, in laboratory/field/fabricating shop, test, D 4417 (06.01)

Filiform corrosion resistance*See* Corrosion (headings)

organic coatings on metal, test, D 2803 (06.01)

Film

exposure of paints/related coatings to fluorescent UV-condensation light-water-exposure apparatus, practice for conducting tests, D 4587 (06.01)

film hardness (of factory-applied organic coatings on metal substrates), by pencil test, D 3363 (06.01)

mandrel bend test of attached organic coatings, test, D 522 (06.01)

preparation of free films of organic coatings, practice, D 4708 (06.01)

preparing drawdowns of artists' paste paints, practice, D 4941 (06.01)

producing films of uniform thickness of paint/varnish/related products on test panels, test, D 823 (06.01)

reporting paint film failures characteristic of exterior latex paints, classification, D 1848 (06.01)

Film—dry film thickness

coatings on wood products, methods for microscopical measurement, D 2691 (06.01)

coil coatings, application using a wire-wound drawdown bar, practice, D 4147 (06.01)

dry film thickness of nonconductive coatings (applied to nonferrous metal base), nondestructive measurement, test, D 1400 (06.01)

dry-film thickness of organic coatings, using micrometers, test, D 1005 (06.01)

dry film thickness of protective coating systems, by destructive means, test, D 4138 (06.01)

erosion testing of antifouling paints, using high velocity water, test, D 4938 (06.01)

film thickness of pipeline coatings on steel, nondestructive measurement, method, G 12 (06.01)

nonmagnetic coatings (paint/varnish/lacquer), applied to a ferrous base, D 1186 (06.01)

penetration resistance of pipeline coatings, by blunt rod test, G 17 (06.01)

subjecting marine antifouling coating to biofouling and fluid shear forces in natural seawater, test, D 4939 (06.01)

Film—electrical conductors

soluble cellulose nitrate, testing, methods, D 301 (06.02)

Film—formation rates

minimum film formation temperature (MFFT) of emulsion vehicles, test, D 2354 (06.02)

organic coatings (at room temperature), test, D 1640 (06.01)

testing industrial water-reducible coatings, guide, D 4712 (06.01)

Film—wet film thickness

wet film thickness of organic coatings, D 1212 (06.01)

Film failure*See* Failure end point (headings)**Filter-retained solids**

filter-retained solids content of polymer latexes, test, D 5097 (06.02)

Fineness

reporting particle size characteristics of pigments, practice, D 1366 (06.02)

Fineness of grind (dispersion)

fineness of dispersion of pigment-vehicle systems, test, D 1210 (06.01)

printing inks, by NPIRI method, test, D 1316 (06.01)

Finger-rub test

field identification of coatings, test, D 5043 (06.01)

Finite closed-cup flash point methods*See* Flash point (headings)**Fire retardancy***See* Fire testing—fire/flame retardancy**Fire testing—paints/related coatings/materials**

fire retardancy of paints, by cabinet method, test, D 1360 (06.01)

flash/fire point of liquids, by Tag open-cup apparatus, test, D 1310 (06.03)

small-scale evaluation of fire-retardant paints, by 2-foot tunnel method, test, D 3806 (06.01)

sustained burning (of liquid mixtures), by Seta-flash tester (open cup), test, D 4206 (06.01, 06.03)

sustained burning (of low viscosity liquid mixtures), by Wilco test, D 4207 (06.03)

Fire testing—petroleum products

flash/fire point of liquids, by Tag open-cup apparatus, test, D 1310 (06.03)

First aid

handling/sampling phenol and cresylic acid, practice, D 3852 (06.03)

sampling and handling aniline, practice, D 3436 (06.03)

Fischer reagent method (for water content)*See* Karl Fischer reagent method**Fish oil content**

fish oil content of drying oils and their fatty acids, by gas-liquid chromatography, test, D 3725 (06.03)

Fittings

comparative corrosion preventive characteristics of materials used for joints/couplings/fittings/patches in pipeline coatings, test, G 18 (06.01)

Five-degree xylene/5° xylol*See* Xylene (five-degree)**Fixed alignment adhesion tester**

pull-off strength of coatings, using portable adhesion testers, test, D 4541 (06.01)

Flake brass*See* Copper powder/Gold bronze powder**Flaked powders**

sampling/testing flaked aluminum powders/pastes, methods, D 480 (06.03)

Flake white*See* Basic carbonate white lead**Flaking**

exterior paints, D 772 (06.01)

Flame cleaning

standard pictorial surface preparation standards for painting steel surfaces, D 2200 (06.01)

Flame photometric detectors (FPD)

thiophene content of refined benzene, by gas chromatography (with flame photometric detection), test, D 4735 (06.03)

Flame spread

small-scale evaluation of fire-retardant paints, by 2-foot tunnel method, test, D 3806 (06.01)

Flammability—paints/related coatings/materials

fire retardancy of paints, by cabinet method, test, D 1360 (06.01)

flash/fire point of liquids, by Tag open-cup apparatus, test, D 1310 (06.03)

small-scale evaluation of fire-retardant paints, by 2-foot tunnel method, test, D 3806 (06.01)

sustained burning (of liquid mixtures), by Seta-flash tester (open cup), test, D 4206 (06.01, 06.03)

Index of ASTM Standards, Section 6

Fungal influence—paints/related coatings/materials

- sustained burning (of low viscosity liquid mixtures), by Wick test, D 4207 (06.03)
- flammability—petroleum products
 - flash/fire point of liquids, by Tag open-cup apparatus, test, D 1310 (06.03)
 - flash/no flash method
 - compliance by liquids of closed-cup flash point specifications, D 3934 (06.03)
 - flash point—liquids
 - equilibrium method, test, D 3941 (06.03)
 - flash/fire point of liquids, by Tag open-cup apparatus, test, D 1310 (06.03)
 - flash/no flash equilibrium method, D 3934 (06.03)
 - flash point by Tag closed tester, test, D 56 (06.03)
 - flash point (of fuel oils/lube oils/suspension of solids/liquids), by Pensky-Martens closed tester, test, D 93 (06.03)
 - flash point of liquids, by Setaflash closed-cup apparatus, test, D 3278 (06.03)
 - sustained burning (of liquid mixtures), by Seta-flash tester (open cup), test, D 4206 (06.01, 06.03)
 - sustained burning (of low viscosity liquid mixtures), by Wick test, D 4207 (06.03)
 - tall oil, methods of testing, D 803 (06.03)
- flat interior latex paint
 - See Latex paints
- flexibility
 - mandrel bend test of attached organic coatings, test, D 522 (06.01)
 - organic coatings (paints) on prepainted deformed metallic sheets, test, D 4145 (06.01)
- floor paints/coatings
 - clear floor sealers, performance tests, D 1546 (06.01)
 - solvent-thinned paints, practice for selection and use of test procedures, D 3383 (06.01)
 - water-thinned floor paints, selection and use of test procedures, practice, D 3358 (06.01)
- flow and flow rate—paints/related coatings/materials
 - high shear viscosity (of paints/varnishes/related products), by ICI cone/plate viscometer, test, D 4287 (06.01)
 - shellac (dry/powdered) used for electrical insulation, selecting test methods, D 411 (06.02)
 - testing industrial water-reducible coatings, guide, D 4712 (06.01)
 - viscosity of paints/related materials, by ISO flow cups, test, D 5125 (06.03)
- flowcoat
 - testing industrial water-reducible coatings, guide, D 4712 (06.01)
- flow cup
 - viscosity of paints/related materials, by ISO flow cups, test, D 5125 (06.03)
 - viscosity of paints/varnishes/lacquers, by Ford viscosity cup, test, D 1200 (06.01)
- flue gas desulfurization system
 - design/fabrication (for protective lining application), spec., D 4618 (06.01)
- fluorescent UV-condensation apparatus
 - exposure of paints/related coatings to fluorescent UV-condensation light-water-exposure apparatus, practice for conducting tests, D 4587 (06.01)
 - operating light-/water-exposure apparatus (fluorescent-UV condensation type) for exposure of nonmetallic materials, practice, G 53 (06.01)
- foil
 - film thickness of pipeline coatings on steel, nondestructive measurement, method, G 12 (06.01)
- foots
 - foots in raw linseed oil, by gravimetric method, test, D 1966 (06.03)
 - foots in raw linseed oil, by volumetric method, test, D 1954 (06.03)
- Ford cup
 - viscosity of paints/varnishes/lacquers, by Ford viscosity cup, test, D 1200 (06.01)
- Ford viscometers
 - See Viscometers—Ford
- foreign matter content
 - clarity/cleanliness of (nonpigmented) paint and ink liquids, by visual examination, test, D 2090 (06.02, 06.03)
- formability
 - factory-applied, organic coatings on metal substrates, by Impact-Type Wedge Bend test, D 3281 (06.01)
 - formability/adhesion of zinc-rich primer/chromate complex coatings (on steel), test, D 4146 (06.01)
- formaldehyde
 - acidity, test, D 2379 (06.03)
 - concentration of formaldehyde solutions, test, D 2194 (06.03)
 - formaldehyde- 50 % grade (unhibited) and 37 % grade (inhibited/uninhibited), spec., D 2378 (06.03)
 - free formaldehyde content of amino resins, test, D 1979 (06.02)
 - iron content, test, D 2087 (06.03)
 - methanol content of formaldehyde solutions, test, D 2380 (06.03)
- formic acid content
 - glacial acetic acid, method, D 3546 (06.03)
- forms for exposure tests
 - See Records management
- formulation data
 - calculating formulation physical constants of paints/coatings, practice, D 5201 (06.01)
- Fractionated and distilled fatty acids
 - See Fatty acids—specifications
- free formaldehyde
 - See Formaldehyde
- free monomers
 - unreacted monomer content of latexes, by gas-liquid chromatography, test, D 4747 (06.02)
- free phenols
 - See Phenol
- free silica content
 - See Silica content
- free toluene diisocyanate content
 - urethane prepolymers/coating solutions, by gas chromatography, test, D 3432 (06.02)
- freezing and thawing—resistance
 - freeze-thaw resistance of water-borne coatings, test, D 2243 (06.01)
 - freeze-thaw stability of multicolor lacquers, test, D 2337 (06.01)
- freezing point
 - freezing points of high-purity hydrocarbons, test, D 1015 (06.03)
 - purity of hydrocarbons from freezing points, test, D 1016 (06.03)
 - purity of styrene, by freezing point method, test, D 3799 (06.03)
- French blue
 - See Iron blue
- French chalk
 - See Magnesium silicate
- French ocher
 - See Ocher
- Fresnel reflector rack exposure method
 - accelerated outdoor exposure tests of coatings (applied to metal substrates), practice, D 4141 (06.01)
- friction/frictional properties
 - static friction of coating surfaces, test, D 4518 (06.01)
- Fuel resistance
 - solvent/fuel resistance of traffic paint, test, D 2792 (06.01)
- Fungal influence—paints/related coatings/materials
 - paint films, evaluating degree of surface disfigurement, Δ D 3274 (06.01)

Index of ASTM Standards, Section 6

Fungal influence—paints/related coatings/materials

- presence of and removing microbial (fungal/algae) growth on paint/related coatings, guide, D 4610 (06.01)
- resistance to mold growth on surface of interior paint coatings (in an environmental chamber), test, D 3273 (06.01)

Fungicidal pigments

See Calcium borosilicate/Zinc oxide

Furnace black

See Carbon black (headings)

Furnaces

- chemical/gravimetric analysis of white/yellow thermoplastic traffic marking material containing lead chromate and titanium dioxide, test, D 4797 (06.01)
- nonvolatile and pigment content of electrocoat baths, using muffle furnace, test, D 5145 (06.01)
- pigment content of paint/traffic marking material, by low-temperature furnace ashing, test, D 4451 (06.01)

Furniture finishes

- temperature-change (high-low) resistance of clear nitrocellulose lacquer films applied to wood, test, D 1211 (06.01)

G

GA-CAT comprehensive abrasion test

- abrasion resistance of printed matter, by the ga-cat comprehensive abrasion test, D 5181 (06.01)

Gages

- wet film thickness of organic coatings, by notched gages, practice, D 4414 (06.01)

Galvanized surfaces

See Steel panels/Steel pipe/tube/Steel sheet

Gamma radiation

- effects of radiation on coatings (for light-water nuclear power plants), test, D 4082 (06.01)

Gardner-Coleman method

- oil absorption of pigments, test, D 1483 (06.02)

Gardner color scale

- color of transparent liquids, by Gardner color scale, test, D 1544 (06.01, 06.02, 06.03)

Gardner-Holdt viscometers

See Viscometers—Gardner-Holdt

Garnet lac

- orange shellac and (button lac/garnet lac), spec., D 237 (06.02)
- sampling/testing lac resins (orange shellac/button lac/garnet lac/bleached lac), test, D 29 (06.02)

Gas black pigment

See Pigments—carbon black

Gas checking draft test

- varnish films, test, D 1643 (06.01)

Gas chromatography

See Chromatography—gas (headings)

Gelled vehicle

- laboratory preparation of gelled vehicles, using microwave oven, practice, D 5166 (06.02)

Gel time

- drying oils, test, D 1955 (06.03)
- tar acids, test, D 2870 (06.03)

Generic resin

- field identification of coatings, test, D 5043 (06.01)

Glacial acetic acid

- formic acid in glacial acetic acid, test, D 3546 (06.03)
- glacial (99.8 %) acetic acid (for use in paint/varnish/lacquer/related products), spec., D 3620 (06.03)

Glacial acrylic acid

See Acrylic acid

Glacial methacrylic acid

See Methacrylic acid (glacial)

Glass panel reading surface

- wet film thickness of organic coatings, D 1212 (06.01)

Glass panels

- directional reflectance factor (45-deg 0-deg) of opaque specimens, by broad-band filter reflectometry, test, E 97 (06.01)

surface preparation (for testing paints, varnish, lacquer & related coatings), D 3891 (06.01)

Glass spheres (in traffic paint/markings material)

- chemical/gravimetric analysis of white/yellow thermoplastic traffic marking material containing lead chromate and titanium dioxide, test, D 4797 (06.01)
- sieve analysis of glass spheres (for retroreflective pavement markings/industrial uses), test, D 1214 (06.02)
- test for roundness of, D 1155 (06.02)

Glazing compounds—metal sash

- slump of face glazing/bedding compounds on metal sash, test, D 2376 (06.01)

viscosity of printing inks/vehicles, by falling-rod viscometer, test, D 4040 (06.01)

Gloss

- clear/pigmented organic coatings, test, D 1308 (06.01)
- gloss differences between surfaces of similar appearance, method for visual evaluation, D 4449 (06.01)
- gloss of high-gloss/metallic/nonmetallic surfaces, by gonioscopic method, method, E 430 (06.01)
- gloss/sheen uniformity evaluation, test, D 3928 (06.01)
- practical washability of organic coatings, test, D 4828 (06.01)
- reflection haze of high gloss surfaces, test, D 4039 (06.01)
- specular gloss of nonmetallic specimens, test, D 523 (06.01)

Gloss paints

- interior latex semigloss/gloss paints, selecting test methods, guide, D 4540 (06.01)

Glue gas desulfurization (FGD)

- inspection of linings in operating flue gas desulfurization systems, practice, D 4619 (06.01)

Glycerin—high-gravity

- high-gravity glycerin, spec., D 1257 (06.03)
- sampling/testing high-gravity glycerin, test, D 1258 (06.03)

Glycerol and ethylene glycol content

- glycerol/ethylene glycol/pentaerythritol in alkyd resins, test, D 1615 (06.02)

Glycidyl ethers

- total chlorine content in epoxy resins/compounds, test, D 4301 (06.02)

Glycol ethers

- purity of propylene glycol monomethyl ether/dipropylene glycol monomethyl ether/propylene glycol monomethyl ether acetate, test, D 4773 (06.03)

Glycols

See Engine coolants

Gold bronze powder

- chemical analysis of cuprous oxide/copper pigments, test, D 283 (06.02)
- gold bronze powder, spec., D 267 (06.02)

Government specification

- fire retardancy of paints, by cabinet method, test, D 1360 (06.01)

Grading

- sampling/grading rosin (delivered in commercial bags/barrels/drum), test, D 509 (06.03)

Graphics

- abrasion resistance of printed matter, by the ga-cat comprehensive abrasion test, D 5181 (06.01)

Graphitic mica

See Stone—mica

Gravimetric method

- resin solution dilutability, test, D 5062 (06.03)
- water pickup of lithographic printing inks/vehicles in a laboratory mixer, test, D 4942 (06.01)
- white/yellow thermoplastic traffic marking material containing lead chromate and titanium dioxide, test, D 4797 (06.01)

Index of ASTM Standards, Section 6

Heating tests—paints/related coatings/materials

Green pigments

See **Chrome green/Chromium oxide green**

Phthalocyanine green

yellow/orange/green pigments containing lead chromate/
chromium oxide green, analysis, test, **D 126 (06.02)**

Grind (pigments)

See **Fineness of grind (dispersion)**

Grit

filter-retained solids content of polymer latexes, test,
D 5097 (06.02)

Grit content

grit content of mica pigment, test, **D 716 (06.02)**

Ground dolomite/limestone/oyster shell

See **Calcium carbonate**

Guides for testing paints/related coatings/materials

alkyd resins, practice, **D 2689 (06.02)**

amino resins, selecting test procedures, practice, **D 4277 (06.02)**

analysis of electrocoat bath samples, guide, **D 1978 (06.01)**

architectural paints/coatings (solvent-/water-thinned),
D 2833 (06.01)

chemical analysis of white pigments, selection of test methods,
guide, **D 34 (06.02)**

clear/pigmented lacquers, **D 333 (06.01)**

coil coatings, testing, practice, **D 3794 (06.01)**

drying oils, selecting test methods, guide, **D 555 (06.03)**

epoxy resins, selecting test procedures, practice, **D 4142 (06.02)**

evaluation of (clear/pigmented) coatings for rigid/semirigid
plastic substrates, practice, **D 3002 (06.01)**

exterior latex house paints, practice, **D 3129 (06.01)**

exterior solvent-based house/trim coatings, practice,
D 2932 (06.01)

fatty acids used in protective coatings—terminology and
selecting test methods, guide, **D 1467 (06.03)**

fatty nitrogen products, **D 2071 (06.03)**

floor paints (solvent-thinned), practice, **D 3383 (06.01)**

floor paints (water-thinned), practice, **D 3358 (06.01)**

interior flat wall paints (latex), practice, **D 2931 (06.01)**

interior flat wall paints (solvent-thinned), practice,
D 3323 (06.01)

interior latex semigloss/gloss paints, selecting test methods,
guide, **D 4540 (06.01)**

interior semigloss wall/trim enamels (solvent-thinned), practice,
D 3425 (06.01)

latex vehicles, selecting test procedures, practice, **D 4143 (06.02)**

nonvolatile matter content (of paint/raw paint materials),
practice, **D 2832 (06.01)**

polymeric powders/powder coatings, practice, **D 3451 (06.01)**

polymerized fatty acids, selecting test methods, **D 2575 (06.03)**

poly(vinyl chloride) resins, guide, **D 4368 (06.02)**

printing inks/ink films/related materials, selecting test methods,
guide, **D 5010 (06.01)**

sampling/testing volatile solvents/chemical intermediates (for
paints/lacquer/varnish/related material), selecting test
methods, **D 268 (06.03)**

testing industrial water-reducible coatings, guide, **D 4712 (06.01)**

testing primers/primer surfacers over preformed metal,
selection/use of procedures, practice, **D 3322 (06.01)**

traffic paints, practice, **D 2205 (06.01)**

traffic paint, uniformity of vehicle solids, by spectroscopy/gas
chromatography, practice, **D 2743 (06.01)**

varnish, **D 154 (06.01)**

volatile/nonvolatile content (of cellulose/emulsions/resin
solutions/shellac/varnishes), selecting test procedures,
practice, **D 4209 (06.02)**

volatile/nonvolatile content (of driers/drying oils/naval stores
and solvents), selecting test procedures, guide,
D 4140 (06.03)

volatile/nonvolatile content (of pigments), selecting test
procedures, guide, **D 4139 (06.02)**

volatile organic content (VOC) of paints/related coatings,
selecting test procedures, practice, **D 3960 (06.01)**

Gum content

artists' paints (oil/resin-oil/alkyd), spec., **D 4302 (06.01)**

Gum rosin

See **Rosin**

Gum spirits of turpentine

See **Turpentine**

H

Halo-silane coated glass plates

preparation of free films of organic coatings, practice,
D 4708 (06.01)

Halphen-Hicks test

qualitative detection of rosin in varnishes, by Lieberman-
Storch/Halphen-Hicks tests, **D 1542 (06.01, 06.02)**

Handling materials

See **Material handling**

Hardness (indentation)

indentation hardness of organic coatings, by Knoop and Pfund
methods, test, **D 1474 (06.01)**

Hardness tests—organic coatings

film hardness, by pencil test, **D 3363 (06.01)**

hardness of organic coatings, by König/Persoz pendulum
hardness tests, **D 4366 (06.01)**

indentation hardness of organic coatings, by Knoop and Pfund
methods, test, **D 1474 (06.01)**

Hazardous constituents

analytical procedures for determining hazardous constituents in
protective coatings, selecting test methods, guide,
D 3630 (06.01)

Hazard potential—health

analytical procedures for determining hazardous constituents in
protective coatings, selecting test methods, guide,
D 3630 (06.01)

design/use of safety alert system for hazardous work locations in
coating/lining industry, practice, **D 4257 (06.01)**

handling cresylic acid and phenol, practice, **D 3852 (06.03)**

handling naphthalene, maleic/phthalic anhydride, practice,
D 3438 (06.03)

labeling art materials for chronic health hazards, practice,
D 4236 (06.01)

sampling and handling aniline, practice, **D 3436 (06.03)**

sampling/handling 4,4'-isopropylidene diphenol (bisphenol-A),
practice, **D 4297 (06.03)**

Haze

See **Gloss**

cellulose acetate propionates/butyrate, test, **D 817 (06.02)**

cellulose acetate, test, **D 871 (06.02)**

gloss of high-gloss metallic/nonmetallic surfaces, by goniophoto-
metry, method, **E 430 (06.01)**

reflection haze (of high gloss surfaces), test, **D 4039 (06.01)**

Heat and flame response

See **Flash point (headings)**

Heat-bodied drying oils

acetone tolerance of heat-bodied drying oils, test,
D 1950 (06.03)

Heated black box exposure test

accelerated outdoor exposure tests of coatings (applied to metal
substrates), practice, **D 4141 (06.01)**

Heating tests—paints/related coatings/materials

cellulose acetate propionates/butyrate, test, **D 817 (06.02)**

chemical/gravimetric analysis of white/yellow thermoplastic
traffic marking material containing lead chromate and
titanium dioxide, test, **D 4797 (06.01)**

distillation of industrial aromatic hydrocarbons/related
materials, method, **D 850 (06.03)**

evaluating (interior/exterior) coatings for protecting steel
surfaces at high-temperature service, test, **D 2485 (06.01)**

loss on heating of drying oils, test, **D 1960 (06.03)**

Index of ASTM Standards, Section 6

Heating tests—paints/related coatings/materials

- stroke cure time of thermosetting phenol-formaldehyde resins, test, **D 4640 (06.02)**
- sustained burning (of liquid mixtures), by Seta-flash tester (open cup), test, **D 4206 (06.01, 06.03)**
- sustained burning (of low viscosity liquid mixtures), by Wick test, **D 4207 (06.03)**
- temperature-change (high-low) resistance of clear nitrocellulose lacquer films applied to wood, test, **D 1211 (06.01)**
- water resistance of coatings, using controlled condensation, practice, **D 4585 (06.01)**
- Heatset-type printing inks**
- nonvolatile content of printing inks/resin solutions/vehicles, test, **D 4713 (06.01)**
- Heavy metals**
- lead/cadmium/cobalt content (low concentrations) in nonvolatile portion of liquid coatings/dried films, by atomic absorption spectroscopy, test, **D 3335 (06.01)**
- Heavy metals content**
- hydrogen sulfide/sulfur dioxide (qualitative) of industrial aromatic hydrocarbons, test, **D 2363 (06.02)**
- methylcellulose, test, **D 1347 (06.02)**
- Hegman scale**
- fineness of dispersion of pigment-vehicle systems, test, **D 1210 (06.01)**
- Hematite**
- See Iron oxide red
- n-Heptane**
- flash/fire point of liquids, by Tag open-cup apparatus, test, **D 1310 (06.03)**
- heptane miscibility of lacquer solvents, test, **D 1476 (06.03)**
- purity of hydrocarbons from freezing points, test, **D 1016 (06.03)**
- Heptane miscibility**
- See Miscibility
- heptane miscibility of lacquer solvents, test, **D 1476 (06.03)**
- Herring content**
- fish oil content (of drying oils and their fatty acids), by gas-liquid chromatography, test, **D 3725 (06.03)**
- n-Hexane**
- purity of hydrocarbons from freezing points, test, **D 1016 (06.03)**
- Hexanes**
- commercial hexanes, spec., **D 1836 (06.03)**
- Hexyl acetate**
- hexyl acetate, spec., **D 5137 (06.03)**
- Hexylene glycol**
- hexylene glycol, spec., **D 2636 (06.03)**
- Hiding power**
- hiding power of architectural paints applied by roller, test, **D 5150 (06.01)**
- Hiding power—paints/coatings**
- comparison of the brush drag of latex paints, test, **D 4958 (06.01)**
- hiding power of paints, by reflectometry, test, **D 2805 (06.01)**
- relative dry hiding power, **D 344 (06.01)**
- wet-to-dry hiding change of architectural coatings, test, **D 5007 (06.01)**
- High-flash aromatic naphthas**
- See Naphtha and naphtha derivatives
- High-gravity glycerin**
- See Glycerin—high-gravity
- High-purity water**
- reagent water, spec., **D 1193 (06.03)**
- High resilience polyurethane foam**
- See Urethanes—foam
- High shear viscosity**
- comparison of the brush drag of latex paints, test, **D 4958 (06.01)**

- High-speed centrifugal vehicle separations**
- See Vehicle separation
- High velocity water**
- erosion testing of antifouling paints, using high velocity water, test, **D 4938 (06.01)**
- High voltage continuity testing**
- continuity verification of liquid/sheet linings applied to metallic substrates, practice, **D 4787 (06.01)**
- High voltage spark testing**
- discontinuity (holiday) testing of nonconductive protective coatings on metallic substrates, practice, **D 5162 (06.01)**
- Holiday detection**
- cathodic disbonding of pipeline coatings, accelerated procedure, test, **G 8 (06.01)**
- continuity verification of liquid/sheet linings applied to metallic substrates, practice, **D 4787 (06.01)**
- disbonding characteristics of pipeline coatings, by liquid immersion, test, **G 19 (06.01)**
- discontinuity (holiday) testing of nonconductive protective coatings on metallic substrates, practice, **D 5162 (06.01)**
- impact resistance of pipeline coatings, by limestone drop test, test, **G 13 (06.01)**
- Horizontal pull test**
- static friction of coating surfaces, test, **D 4518 (06.01)**
- Humidity**
- humid-dry cycling for coatings on wood/wood products, test, method, **D 3459 (06.01)**
- humidity-thermal cycle cracking, testing finishes on steel surfaces, **D 2246 (06.01)**
- Humidity—relative**
- testing water resistance of coatings at 100 % relative humidity, practice, **D 2247 (06.01)**
- Hunter appearance**
- gloss differences between surfaces of similar appearance, method for visual evaluation, **D 4449 (06.01)**
- Hydrated iron oxide**
- ochre pigment, spec., **D 85 (06.02)**
- Hydrocarbon content—nonaromatic**
- total non-aromatic/trace monocyclic hydrocarbon aromatic hydrocarbons in high-purity benzene/toluene/m-xylene/xylenes, by gas chromatography, test, **D 2360 (06.03)**
- xylene isomer analysis, by gas chromatography, test, **D 2306 (06.03)**
- Hydrocarbons**
- acidity in volatile solvents/chemical intermediates (used in paint/varnish/lacquer/related products), test, **D 1613 (06.03)**
- benzene content of cyclic hydrocarbon products, by gas chromatography, test, **D 4534 (06.03)**
- dichloromethane/1,1,1-trichloroethane content in paints/coatings, by direct injection gas chromatography, test, **D 4457 (06.01)**
- high-flash aromatic naphthas, spec., **D 3734 (06.03)**
- mineral (petroleum) spirits hydrocarbon drycleaning solvents, spec., **D 235 (06.03)**
- sampling/handling liquid cyclic products (at ambient temperature), practice, **D 3437 (06.03)**
- unreacted monomer content of latexes, by gas-liquid chromatography, test, **D 4747 (06.02)**
- VM & P naphthas, spec., **D 3735 (06.03)**
- Hydrocarbons—aromatic**
- aromatic hydrocarbons/related chemicals, terminology, **D 4790 (06.03)**
- bromine content, by coulometric titration, test, **D 1492 (06.03)**
- color (of solid aromatic hydrocarbons/related materials in molten state), by platinum-cobalt scale, test, **D 1686 (06.03)**
- solidification point of 4,4'-isopropylidenediphenol (Bisphenol A), test, **D 4493 (06.03)**

- total non-aromatic/trace monocyclic hydrocarbon aromatic hydrocarbons in high-purity benzene/toluene/mixed xylenes, by gas chromatography, test, **D 2360 (06.03)**
- trace (total) chloride (organic/inorganic) in liquid aromatic hydrocarbons, test, **D 5194 (06.03)**
- Hydrocarbons—high-purity**
- commercial density (of pure liquid chemicals), test, **D 3505 (06.03)**
- freezing points of high-purity hydrocarbons, test, **D 1015 (06.03)**
- purity of hydrocarbons from freezing points, test, **D 1016 (06.03)**
- solidification point of industrial organic chemicals, test, **D 1493 (06.03)**
- Hydrocarbons—industrial aromatic**
- acidity of benzene/toluene/xylenes/solvent naphthas/similar industrial aromatic hydrocarbons, test, **D 847 (06.03)**
- acid wash color, test, **D 848 (06.03)**
- apparent density of industrial aromatic hydrocarbons, test, **D 2935 (06.03)**
- commercial density (of pure liquid chemicals), test, **D 3505 (06.03)**
- copper corrosion of industrial aromatic hydrocarbons, test, **D 849 (06.03)**
- distillation, test, **D 850 (06.03)**
- hydrogen sulfide and sulfur dioxide content (qualitative), test, **D 853 (06.03)**
- solidification point of industrial organic chemicals, test, **D 1493 (06.03)**
- sulfur (trace quantities) in liquid aromatic hydrocarbons, by oxidative microcoulometry, test, **D 3961 (06.03)**
- volume/weight of industrial aromatic hydrocarbons, method, **D 1555 (06.03)**
- Hydrocarbons—light**
- volume/weight of industrial aromatic hydrocarbons, method, **D 1555 (06.03)**
- Hydrodynamic stress**
- subjecting marine antifouling coating to biofouling and fluid shear forces in natural seawater, test, **D 4939 (06.01)**
- Hydrogen sulfide content**
- industrial aromatic hydrocarbons, test, **D 853 (06.03)**
- Hydrolyzable chlorine content**
- hydrolyzable chlorine content of liquid epoxy resins, test, **D 1726 (06.02)**
- Hydroquinone content**
- hydroquinone in vinyl acetate, test, **D 2193 (06.03)**
- Hydroxyacetone content**
- analysis of major organic impurities in phenol produced by the cumene process, by gas chromatography, test, **D 4961 (06.03)**
- Hydroxyethylcellulose**
- hydroxyethylcellulose, test, **D 2364 (06.02)**
- Hydroxyl (hydroxide ion) content**
- hydroxyl content of cellulose acetate, by spectrophotometry, test, **D 871 (06.02)**
- hydroxyl content of pyridine-soluble cellulose esters, by spectrophotometry, test, **D 817 (06.02)**
- hydroxyl value of fatty oils/acids, test, **D 1957 (06.03)**
- pentaerythritol (for manufacture of alkyd/other synthetic resins), tests, **D 2195 (06.03)**
- Hydroxypropoxyl content**
- hydrogen sulfide/sulfur dioxide (qualitative) of industrial aromatic hydrocarbons, test, **D 2363 (06.02)**
- Hydroxypropyl methylcellulose**
- hydrogen sulfide/sulfur dioxide (qualitative) of industrial aromatic hydrocarbons, test, **D 2363 (06.02)**
- Hydroxypropyl substitution**
- methoxyl/hydroxypropyl substitution in cellulose ether products, by Zeisel-gas chromatography, test, **D 3876 (06.02)**
- Hygroscopic materials/properties/tests**
- hygroscopic moisture (and other matter volatile under test conditions) in pigments, test, **D 280 (06.02)**
- water content in phenol/related materials, by iodine reagent method, test, **D 1631 (06.03)**
- ICI cone/plate viscometer**
- high shear viscosity (of paints/varnishes/related products), by ICI cone/plate viscometer, test, **D 4287 (06.01)**
- Identification**
- field identification of coatings, test, **D 5043 (06.01)**
- Ignition—loss on ignition**
- moisture content of pigments, **D 1208 (06.02)**
- Ignition residues of drying oils**
- See Ash content
- Immersion**
- chemical resistance of pipeline coatings, test, **G 20 (06.01)**
- comparative corrosion preventive characteristics of materials used for joints/couplings/fittings/patches in pipeline coatings, test, **G 18 (06.01)**
- water penetration into pipeline coatings, test, **G 9 (06.01)**
- Impact testing—pipeline coatings**
- effects of outdoor weathering on pipeline coatings, test, **G 11 (06.01)**
- impact resistance of pipeline coatings, by falling weight test, **G 14 (06.01)**
- impact resistance of pipeline coatings, by limestone drop test, **G 13 (06.01)**
- Impressed current system**
- cathodic disbonding of pipeline coatings, accelerated procedure, test, **G 8 (06.01)**
- Imprinting**
- print resistance of architectural paints, test, **D 2064 (06.01)**
- print resistance of lacquers, test, **D 2091 (06.01)**
- Impurities**
- analysis of styrene by capillary gas chromatography, test, **D 5135 (06.03)**
- Impurities—paints/related coatings/materials**
- analysis of major organic impurities in phenol produced by the cumene process, by gas chromatography, test, **D 4961 (06.03)**
- analysis of *p*-xylene, by gas chromatography, method, **D 3798 (06.03)**
- chemical analysis of benzene, by gas chromatography, test, **D 4492 (06.03)**
- impurities in high-purity ethylbenzene, by gas chromatography, test, **D 5060 (06.03)**
- purity of propylene glycol monomethyl ether/dipropylene glycol monomethyl ether/propylene glycol monomethyl ether acetate, test, **D 4773 (06.03)**
- pyridine base content in cresylic acid, by direct titration, test, **D 4471 (06.03)**
- styrene, by gas chromatography, test, **D 3962 (06.03)**
- Inclined plane method**
- static friction of coating surfaces, test, **D 4518 (06.01)**
- Inclusions**
- continuity verification of liquid/sheet linings applied to concrete substrates, practice, **D 4787 (06.01)**
- Index of refraction (refractive index)**

- See Iron oxide red
- Industrial aromatic hydrocarbons**
- See Hydrocarbons—industrial aromatic

Index of ASTM Standards, Section 6

Industrial grade benzene/toluene/xylene

Industrial grade benzene/toluene/xylene

See **Benzene/Toluene/Xylene (headings)**

Industrial materials/applications—chemicals

See **Chemicals**

solidification point of industrial organic chemicals, test, D 1493 (06.03)

Industrial materials/applications—paints/related coatings

testing industrial water-reducible coatings, guide, D 4712 (06.01)
viscosity of paints/related materials, by ISO flow cups, test, D 5125 (06.03)

Inert pigments

See **Extender pigments**

Infrared (IR) analysis

qualitative identification of polymers in emulsion paints, by infrared analysis/pyrolysis-gas liquid chromatography, practice, D 3168 (06.01)

Infrared (IR) analysis—paints/related coatings/materials

cellulose nitrate in alkyd lacquers, quantitative determination by infrared spectrophotometry, test, D 3133 (06.01)
infrared identification of vehicle solids from solvent-reducible paints, by infrared spectroscopy, test, D 2621 (06.01)
temperature of applied coatings on wood products during the curing cycle, by infrared radiation thermometers, practice, D 3259 (06.01)

Infrared pyrometer

temperature of applied coatings on wood products during the curing cycle, by infrared radiation thermometers, practice, D 3259 (06.01)

Infrared spectrophotometry

See **Spectrophotometry—Infrared**

Infusorial earth

See **Silica—diatomaceous**

Inhibitor

zinc yellow (zinc chromate) pigments, spec., D 478 (06.02)

Inhibitor content

p-tert-butylcatechol (TBC) in styrene monomer, test, D 2120 (06.03)
residual *p*-tert-butylcatechol (TBC) in styrene monomer, by addition of NaOH, test, D 4590 (06.03)

Ink

apparent tack of printing inks/vehicles, by inkometer, test, D 4361 (06.01)
clarity/cleanliness of (nonpigmented) paint and ink liquids, by visual examination, test, D 2090 (06.02, 06.03)
lightfastness of printed matter, D 3424 (06.01)
nonvolatile content of printing inks/resin solutions/vehicles, test, D 4713 (06.01)
water pickup of lithographic printing inks/vehicles in a laboratory mixer, test, D 4942 (06.01)

Inkometer method

apparent tack of printing inks/vehicles, by inkometer, test, D 4361 (06.01)

Inorganic colored pigments

chemical analysis of yellow/orange/red/brown pigments containing iron/manganese, test, D 50 (06.02)

Inorganic linings

inspection of linings in operating flue gas desulfurization systems, practice, D 4619 (06.01)

Insoluble matter content

lead peroxide/true red lead content of dry red lead pigments, test, D 49 (06.02)
sampling/testing lac resins (orange shellac/buttern lac/garnet lac/bleached lac), test, D 29 (06.02)

Inspection—coating applications

design/fabrication of flue gas desulfurization system components (for protective lining application), spec., D 4618 (06.01)
establishing procedures to monitor performance of safety related coatings in operating nuclear power plant, guide, D 5163 (06.01)

establishing procedures to qualify/certify inspection personnel for coating work in nuclear facilities, guide, D 4537 (06.01)
inspection of linings in operating flue gas desulfurization systems, practice, D 4619 (06.01)
painting inspectors (metal substrates), guide, D 3276 (06.01)
specifying inspection requirements for coating/finishing of metal substrates, guide, D 5161 (06.01)

Inspection personnel

establishing procedures to qualify/certify inspection personnel for coating work in nuclear facilities, guide, D 4537 (06.01)

Instrumental measurement—color/light

See **Light—exposure**

Instrumental measurement—paints/related coatings/materials

accelerated testing of paints/varnishes/lacquers/related products using filtered open flame carbon-arc light/water exposure apparatus, practice, D 822 (06.01)
bond strength of thermoplastic traffic marking materials on cement bricks/steel cubes, test, D 4796 (06.01)
cathodic disbonding of pipeline coatings, accelerated procedure, test, G 8 (06.01)
directional reflectance factor (45-deg 0-deg) of opaque specimens, by broad-band filter reflectometry, test, E 97 (06.01)
evaluation of color for thermoplastic traffic marking materials, test, D 4960 (06.01)
gloss of high-gloss metallic/nonmetallic surfaces, by goniospectrometry, method, E 430 (06.01)
relative tinting strength of white pigments, by reflectance measurements, test, D 2745 (06.02)
testing industrial water-reducible coatings, guide, D 4712 (06.01)

Insulating coating systems

cathodic disbonding of pipeline coatings, accelerated procedure, test, G 8 (06.01)
effects of outdoor weathering on pipeline coatings, test, G 11 (06.01)
specific bendability of pipeline coatings, test, G 10 (06.01)
water penetration into pipeline coatings, test, G 9 (06.01)

Interchemical wet film gage

wet film thickness of organic coatings, D 1212 (06.01)

Interior mold environments

See **Resistance—bacteria**

Interior paints/coatings

efflorescence (of interior wall paints), test, D 1736 (06.01)
interior latex semigloss/gloss paints, selecting test methods, guide, D 4540 (06.01)
latex flat wall paint, practice for selection and use of test procedures, D 2931 (06.01)
practical washability of organic coatings, test, D 4828 (06.01)
scrub-to-failure of interior latex flat wall paints, test, D 2486 (06.01)
solvent-thinned flat wall paint, practice for selection and use of test procedures, D 3323 (06.01)
solvent-thinned wall/trim semigloss enamels, practice for selection and use of test procedures, D 3425 (06.01)
testing solvent-borne architectural (interior/exterior) coatings, guide, D 5146 (06.01)
testing water resistance of coatings at 100% relative humidity, practice, D 2247 (06.01)
wet abrasion resistance of interior paints to scrubbing, by weight loss, test, D 4213 (06.01)

Interlaboratory testing

conducting interlaboratory study to determine precision of test method, practice, E 691 (06.03)
paints/related coatings, practice, D 3980 (06.01)

Internal indicator method

acid number of rosin, test, D 465 (06.03)
saponification number of rosin, test, D 464 (06.03)

Internal voids

continuity verification of liquid/sheet linings applied to concrete substrates, practice, D 4787 (06.01)

Intrinsic viscosity*See Viscosity (headings)*

- intrinsic viscosity of cellulose acetate, using modified Baker-Philippoff equation, test, D 871 (06.02)
- limiting viscosity number of cellulose acetate propionate/butyrate, test, D 817 (06.02)

Iodine-pyridine-sulfur dioxide reagent

- water in liquid naval stores, test, D 890 (06.03)

Iodine reagent method

- water content, in phenol and related materials, test, D 1631 (06.03)

Iodine value

- acid/amine value of fatty quaternary ammonium chlorides, test, D 2078 (06.03)
- fatty amines, amidoamines, and diamines, Wijs procedure, test, D 2075 (06.03)
- sampling and testing shellac varnish, D 1650 (06.02)
- sampling/testing lac resins (orange shellac/buttol lac/garnet lac/bleached lac), test, D 29 (06.02)

Iodine value—drying oils and their derivatives

- modified Rosenmund-Kuhnemann method, test, D 1541 (06.03)
- Wijs method, test, D 1959 (06.03)

Ionic contamination*See Contamination (headings)***Iron**

- raw/burnt sienna pigments, spec., D 765 (06.02)

Iron blue

- chemical analysis of (iron/copper phthalocyanine/ultramarine) blue pigments, test, D 1135 (06.02)
- chemical analysis of phthalocyanine blue/green pigments, test, D 3256 (06.02)
- iron blue pigment, spec., D 261 (06.02)

Iron content—paint driers

- formaldehyde, test, D 2087 (06.03)
- hydrogen sulfide/sulfur dioxide (qualitative) of industrial aromatic hydrocarbons, test, D 2363 (06.02)
- iron in liquid iron paint driers, by EDTA method, test, D 3804 (06.03)
- iron oxide black (natural)- chemical analysis, test, D 3872 (06.02)
- metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)
- methylcellulose, test, D 1347 (06.02)
- rosin, test, D 1064 (06.03)

Iron oxide black

- black synthetic iron oxide pigment, spec., D 769 (06.02)
- iron oxide black (natural)- chemical analysis, test, D 3872 (06.02)

Iron oxide brown (natural)

- analysis, D 50 (06.02)
- natural red/brown iron oxide pigments, spec., D 3722 (06.02)

Iron oxide brown (synthetic)

- iron oxide black (natural)- chemical analysis, test, D 3872 (06.02)
- synthetic brown iron oxide pigment, spec., D 3724 (06.02)

Iron oxide content

- calcium borosilicate, test, D 4487 (06.02)

Iron oxide red (natural)

- analysis, D 50 (06.02)
- natural red/brown iron oxide pigments, spec., D 3722 (06.02)

Iron oxide red (synthetic)

- analysis, D 50 (06.02)
- synthetic red iron oxide pigment, spec., D 3721 (06.02)

Iron oxide yellow

- analysis, D 50 (06.02)
- yellow iron oxide (hydrated), spec., D 768 (06.02)

Iron paint driers*See Driers***Irradiance/irradiation—paints/related coatings/materials**

- effects of radiation on coatings (for light-water nuclear power plants), test, D 4082 (06.01)
- operating light-exposure apparatus (xenon-arc type) with/without water for exposure of nonmetallic materials, practice, G 26 (06.01)

Isatin

- thiophene content of benzene, by spectrophotometry, test, D 1685 (06.03)

Isobutanol*See Isobutyl alcohol***Isobutene (isobutylene)**

- purity of hydrocarbons from freezing points, test, D 1016 (06.03)

Isobutyl acetate

- alcohol content/purity of acetate esters, by gas chromatography, test, D 3545 (06.03)
- isobutyl acetate (95 % grade), spec., D 1718 (06.03)

Isobutyl alcohol

- isobutyl alcohol, spec., D 1719 (06.03)
- isocyanate group content of urethane materials/prepolymers, test, D 2572 (06.02)

ISO cups

- viscosity of paints/related materials, by ISO flow cups, test, D 5125 (06.03)

Isocyanates

- isocyanate group content of urethane materials/prepolymers, test, D 2572 (06.02)

ISO (International Standards Organization)

- index of standards by ISO/TC 35 on Paint and Varnishes, (Related Material) (06.01, 06.02, 06.03)

Isomer analysis

- xylylene isomer analysis, by gas chromatography, test, D 2306 (06.03)

Isocetane

- purity of hydrocarbons from freezing points, test, D 1016 (06.03)

Isophorone

- isophorone, spec., D 2916 (06.03)

Isophthalic acid content

- isophthalic acid content of alkyd/polyester resins, test, D 2690 (06.02)

Isoprene

- purity of hydrocarbons from freezing points, test, D 1016 (06.03)

Isopropanol

- flash/fire point of liquids, by Tag open-cup apparatus, test, D 1310 (06.03)

Isopropyl acetate

- alcohol content/purity of acetate esters, by gas chromatography, test, D 3545 (06.03)
- isopropyl acetate (99 % grade), spec., D 3131 (06.03)

Isopropyl alcohol

- isopropyl alcohol, spec., D 770 (06.03)

Isopropylbenzene (cumene)

- See Cumene (isopropylbenzene)*
- aromatic hydrocarbons/related chemicals, terminology, D 4790 (06.03)
- benzene content of cyclic hydrocarbon products, by gas chromatography, test, D 4534 (06.03)
- impurities in high-purity ethylbenzene, by gas chromatography, test, D 5060 (06.03)
- isopropylbenzene (cumene), spec., D 4077 (06.03)
- phenol content of (refined) isopropylbenzene (cumene), test, D 3160 (06.03)
- purity analysis of isopropylbenzene (cumene), by gas chromatography, test, D 3760 (06.03)
- sampling/handling liquid cyclic products (at ambient temperature), practice, D 3437 (06.03)

Index of ASTM Standards, Section 6

4,4' Isopropylidene diphenol

4,4' Isopropylidene diphenol

- sampling/handling 4,4'-isopropylidene diphenol (bisphenol-A), practice, D 4297 (06.03)
- solidification-point, test, D 4493 (06.03)
- solution color of 4,4'-isopropylidenediphenol (dissolved in methanol), test, D 4789 (06.03)

Ivory black

See Bone black

J

Jaune de zinc

See Zinc yellow

Joints

- comparative corrosion preventive characteristics of materials used for joints/couplings/fittings/patches in pipeline coatings, test, G 18 (06.01)

Jones reductor

- total titanium in white titanium pigments, by Jones reductor, test, D 1394 (06.02)

K

Kaolinite

See Aluminum silicate pigments

Karl Fischer reagent method—water content

- paints/paint materials, test, D 4017 (06.01)
- water in volatile solvents, by Fischer reagent titration method, test, D 1364 (06.03)

Kauri-butanol value

- hydrocarbon solvents, D 1133 (06.03)

Ketones

- aromatic hydrocarbons/related chemicals, terminology, D 4790 (06.03)
- MEK resistance of ethyl silicate (inorganic) zinc-rich primers, by solvent rub, test, D 4752 (06.01)
- methyl ethyl ketone, spec., D 740 (06.03)
- methyl isoamyl ketone, spec., D 2917 (06.03)
- methyl isobutyl ketone, spec., D 1153 (06.03)
- methyl *n*-amyl ketone (98 % grade), spec., D 4360 (06.03)
- purity of aldehydes and ketones, test, D 2192 (06.03)
- purity of methyl (amyl ketone/isoamyl ketone), by gas chromatography, test, D 3893 (06.03)
- purity of methyl ethyl ketone, using gas chromatography, test, D 2804 (06.03)
- purity of methyl isobutyl ketone, by gas chromatography, test, D 3329 (06.03)

Kiln-dry bleached lac

See Bleached lac

Kiln pine tars

See Oils—pine (natural/synthetic)

Knife test

- adhesion of coating films to metallic substrates, by tape test, D 3359 (06.01)

Knoop hardness

- indentation hardness of organic coatings, by Knoop and Pfund methods, test, D 1474 (06.01)

König pendulum test

- hardness of organic coatings, by König/Persoz pendulum hardness tests, D 4366 (06.01)

Krems white

See Basic carbonate white lead

Kubelka-Munk equation

- relative tinting strength of printing ink dispersions, test, D 2066 (06.01)

L

Labeling

- abrasion resistance of printed matter, by the ga-cat comprehensive abrasion test, D 5181 (06.01)

- art materials for chronic health hazards, practice, D 4236 (06.01)

Laboratory

- evaluating and comparing transfer conditions laboratory conditions, test, D 5009 (06.01)
- profile of abrasive blast-cleaned steel surfaces, in laboratory field/fabricating shop, test, D 4417 (06.01)

Laboratory mixer

- water pickup of lithographic printing inks/vehicles in laboratory mixer, test, D 4942 (06.01)

LAC

- orange shellac and (button lac/garnet lac), spec., D 237 (06.03)

Lacquer

- abrasion resistance, by air blast abrasion test, D 658 (06.01)
- abrasion resistance of organic coatings, by falling abrasive, test, D 968 (06.01)
- acidity in volatile solvents/chemical intermediates (used in paint/varnish/lacquer/related products), test, D 1613 (06.03)
- adhesion (to smooth surfaces), by scrape adhesion test, D 2197 (06.01)
- amount of liquid separated as upper layer from a viscous solution/dispersion containing dispersed solids, test, D 4948 (06.01)
- cellulose nitrate in alkyd lacquers, quantitative determination by infrared spectrophotometry, test, D 3133 (06.01)
- clarity/cleanliness of (nonpigmented) paint and ink liquids, by visual examination, test, D 2090 (06.02, 06.03)
- clear and pigmented, selection of test methods, D 333 (06.01)
- clear/pigmented organic coatings, test, D 1308 (06.01)
- conducting tests on paint/varnish/lacquer/related products using enclosed carbon-arc light/water exposure apparatus, practice, D 5031 (06.01)
- discoloration (light stability), test, D 2620 (06.01)
- dry film thickness of nonconductive coatings (applied to nonferrous metal base), nondestructive measurement, test, D 1400 (06.01)
- dry film thickness (of nonmagnetic organic coatings applied to ferrous base), D 1186 (06.01)
- dry-film thickness of organic coatings, using micrometers, test, D 1005 (06.01)
- effects of overbaking on organic coatings, practice, D 2454 (06.01)
- elongation/tensile strength/stiffness, test, D 2370 (06.01)
- ester value of solvents and thinners, test, D 1617 (06.03)
- field identification of coatings, test, D 5043 (06.01)
- film formation rates in drying or curing process, at room temperature, test, D 1640 (06.01)
- flash point of liquids, by Setflash closed-cup apparatus, test, D 3278 (06.03)
- freeze-thaw stability of multicolor lacquers, test, D 2337 (06.01)
- glacial acrylic acid (99.0 % grade), spec., D 4416 (06.03)
- heptane miscibility of lacquer solvents, test, D 1476 (06.03)
- imprint resistance, of dried films, test, D 2091 (06.01)
- indentation hardness of organic coatings, by Knoop and Pfund methods, test, D 1474 (06.01)
- methyl *n*-amyl ketone (98 % grade), spec., D 4360 (06.03)
- moisture vapor transmission of organic coating films, test, D 1653 (06.01)
- paint/varnish/lacquer/related products, terminology, D 16 (06.01, 06.02, 06.03)
- paint/varnish/lacquer/related products, test, D 1475 (06.01)
- particle size analysis (of multicolored/nitrocellulose-base lacquer), test, D 2338 (06.01)
- plasticizer migration from vinyl fabrics to lacquers, method, D 2199 (06.01)
- preparation of free films of organic coatings, practice, D 4708 (06.01)
- preparing glass panels for testing, D 3891 (06.01)
- resistance to failure (on steel surfaces), by water immersion test, D 870 (06.01)

Index of ASTM Standards, Section 6

stain removal (of multicolored lacquer on primed steel panels), test, D 2198 (06.01)
 standard environments for conditioning/testing paint/varnish/lacquer/related materials, spec., D 3924 (06.01)
 temperature-change (high-low) resistance of clear nitrocellulose lacquer films applied to wood, test, D 1211 (06.01)
 viscosity of paints/varnishes/lacquers, by Ford viscosity cup, test, D 1200 (06.01)
 viscosity (of paints/varnishes/lacquers/related materials), by dip-type viscosity cups, test, D 4212 (06.01)
 wet film thickness of organic coatings, D 1212 (06.01)
 wet film thickness of organic coatings, by notched gages, practice, D 4414 (06.01)
 wood furniture lacquers, test, D 2571 (06.01)

Lac resins

See Resins—lac

Lampblack

lampblack pigment, spec., D 209 (06.02)
 solvent extractable material in black pigments, test, D 305 (06.02)

Lampblack content

solvent extractable material in black pigments, test, D 305 (06.02)

Lapis lazuli

See Ultramarine blue

Latex paints

antimony content (low concentrations) in solids of liquid coatings/dried films, by atomic absorption spectroscopy, test, D 3717 (06.01)
 artists' acrylic emulsion paints, spec., D 5098 (06.01)
 blocking resistance of trade sales paints, test, D 4946 (06.01)
 chromium content (low concentrations) in solids of liquid coatings/dried films, by atomic absorption spectroscopy, test, D 3718 (06.01)
 coarse particles in pigments/pastes/paints, test, D 185 (06.01, 06.02)
 color differences of opaque materials, instrumental evaluation, test, D 2244 (06.01)
 comparison of the brush drag of latex paints, test, D 4958 (06.01)
 conducting tests on paint/varnish/lacquer/related products, using enclosed carbon-arc light/water exposure apparatus, practice, D 5031 (06.01)
 consistency of paints, using Stormer viscometer, test, D 562 (06.01)
 directional reflectance factor (45-deg-0-deg) of opaque specimens, by broad-band filter reflectometry, test, E 97 (06.01)
 drying/curing/film formation (at room temperature), test, D 1640 (06.01)
 efflorescence (of interior wall paints), test, D 1736 (06.01)
 field identification of coatings, test, D 5043 (06.01)
 filter-retained solids content of polymer latexes, test, D 5097 (06.02)
 fineness of dispersion of pigment-vehicle systems, test, D 1210 (06.01)
 freeze-thaw resistance of water-borne coatings, test, D 2243 (06.01)
 gloss/sheen uniformity evaluation, test, D 3928 (06.01)
 hiding power of architectural paints applied by roller, test, D 5150 (06.01)
 hiding power of paints, by reflectometry, test, D 2805 (06.01)
 hiding power (relative dry), visual evaluation of brushouts, test, D 344 (06.01)
 high shear viscosity (of paints/varnishes/related products), by ICI cone/plate viscometer, test, D 4287 (06.01)
 lead/cadmium/cobalt content (low concentrations) in nonvolatile portion of liquid coatings/dried films, by atomic absorption spectroscopy, test, D 3335 (06.01)
 leveling, by draw-down method, test, D 4062 (06.01)
 low temperature coalescence, test, D 3793 (06.01)

mandrel-bend test of attached organic coatings, test, D 522 (06.01)
 mercury content (low concentrations) in liquid coatings/coatings vehicles/dried films, by atomic absorption spectroscopy, test, D 3624 (06.01)
 nonvolatile content of latexes, test, D 4758 (06.02)
 package stability of solvent-reducible/water-reducible paint, test, D 1849 (06.01)
 paint spatter resistance to roller application, test, D 4707 (06.01)
 paint/varnish/lacquer/related products, test, D 1475 (06.01)
 preparing drawdowns of artists' paste paints, practice, D 4941 (06.01)
 producing films of uniform thickness of paint/varnish/related products on test panels, test, D 823 (06.01)
 qualitative identification of polymers in emulsion paints, by infrared analysis/pyrolysis-gas liquid chromatography, practice, D 3168 (06.01)
 relative tinting strength of chromatic paints, test, D 4838 (06.01)
 reporting paint film failures characteristic of exterior latex paints, classification, D 1848 (06.01)
 sag resistance, using multinoth applicator, test, D 4400 (06.01)
 sampling liquid paints/related pigmented coatings, practice, D 3925 (06.01)
 scrub-to-failure of interior latex flat wall paints, test, D 2486 (06.01)
 specular gloss of nonmetallic specimens, test, D 523 (06.01)
 testing water resistance of coatings at 100 % relative humidity, practice, D 2247 (06.01)
 unreacted monomer content of latexes, by gas-liquid chromatography, test, D 4747 (06.02)
 unreacted monomer content of latexes using capillary column gas chromatography, test, D 4827 (06.02)
 volatile content, test, D 2369 (06.01)
 volatile organic content (VOC) of paints/related coatings, selecting test procedures, practice, D 3960 (06.01)
 volume nonvolatile matter in clear/pigmented coatings, test, D 2697 (06.01)
 washability of interior architectural coatings, test, D 3450 (06.01)
 water content of paints/paint materials, by Karl Fischer method, test, D 4017 (06.01)
 water content of water-reducible paints, by direct injection into gas chromatograph, test, D 3792 (06.01)
 water-thinned floor paints, selection and use of test procedures, practice, D 3358 (06.01)
 wet abrasion resistance of interior paints to scrubbing, by weight loss, test, D 4213 (06.01)
 wet-to-dry hiding change of architectural coatings, test, D 5007 (06.01)
 wood used as panels in weathering tests of coatings, spec., D 358 (06.01)

Latex paints—selection and use of test procedures

exterior latex house paint, practice, D 3129 (06.01)
 floor paint, practice, D 3358 (06.01)
 interior flat wall paint, practice, D 2931 (06.01)
 interior latex semigloss/gloss paints, selecting test methods, guide, D 4540 (06.01)
 latex vehicles, selecting test procedures, practice, D 4143 (06.02)

Latex vehicles

nonvolatile content of latexes, test, D 4758 (06.02)
 unreacted monomer content of latexes, by gas-liquid chromatography, test, D 4747 (06.02)
 unreacted monomer content of latexes using capillary column gas chromatography, test, D 4827 (06.02)

Leachates/leaching

water-soluble salts in pigments, by measuring specific resistance of pigment leachate, test, D 2448 (06.02)

Lead chromate

chemical/gravimetric analysis of white/yellow thermoplastic traffic marking material containing lead chromate and titanium dioxide, test, D 4797 (06.01)

Lead chromate

Index of ASTM Standards, Section 6

Lead chromate

- lead/chromium content (in air particulate filter samples of lead chromate type pigment dusts), by atomic absorption spectroscopy, test, D 4358 (06.02)
- Lead chromate pigment**
 - yellow/orange/green pigments containing lead chromate/chromium oxide green, analysis, test, D 126 (06.02)
- Lead content—paints/related coatings/materials**
 - analysis of white zinc pigments, test, D 3280 (06.02)
 - chromium trioxide content of basic lead silico-chromate pigment, test, D 1844 (06.02)
 - detection of lead in paint/dried paint films, test, D 3618 (06.01)
 - lead/cadmium/cobalt content (low concentrations) in nonvolatile portion of liquid coatings/dried films, by atomic absorption spectroscopy, test, D 3335 (06.01)
 - lead/chromium content (in air particulate filter samples of lead chromate type pigment dusts), by atomic absorption spectroscopy, test, D 4358 (06.02)
 - lead content in paint, by direct aspiration atomic absorption spectroscopy, test, D 4834 (06.01)
 - lead peroxide/true red lead content of dry red lead pigments, test, D 49 (06.02)
 - liquid paint driers, selection of test methods, D 564 (06.03)
 - paint driers, by EDTA method, test, D 2374 (06.03)
 - white linseed oil paints- chemical analysis, selecting test methods, practice, D 215 (06.01)
 - yellow/orange/green pigments containing lead chromate/chromium oxide green, test, D 126 (06.02)
- Leaded zinc oxide**
 - analysis of white zinc pigments, test, D 3280 (06.02)
- Lead peroxide content**
 - lead peroxide/true red lead content of dry red lead pigments, test, D 49 (06.02)
- Lead salt infrared radiation thermometers**
 - temperature of applied coatings on wood products during the curing cycle, by infrared radiation thermometers, practice, D 3259 (06.01)
- Lead screening test**
 - lead content in paint, by direct aspiration atomic absorption spectroscopy, test, D 4834 (06.01)
- Lead silicochromate**
 - lead/chromium content (in air particulate filter samples of lead chromate type pigment dusts), by atomic absorption spectroscopy, test, D 4358 (06.02)
- Leafing properties**
 - sampling/testing flaked aluminum powders/pastes, methods, D 480 (06.03)
- Leveling characteristics**
 - architectural paints/coatings (aqueous/nonaqueous), in white/light tints, by draw-down method, test, D 4062 (06.01)
- Lieberman-Storch test**
 - qualitative detection of rosin in varnishes, by Lieberman-Storch/Halphen-Hicks tests, D 1542 (06.01, 06.02)
- Light—exposure**
 - accelerated testing of paints/varnishes/lacquers/related products, using filtered open flame carbon-arc light/water exposure apparatus, practice, D 822 (06.01)
 - conducting tests on paint/varnish/lacquer/related products, using enclosed carbon-arc light/water exposure apparatus, practice, D 5031 (06.01)
 - cure time of ultraviolet-cured coatings, practice, D 3732 (06.01)
 - exposure of paints/related coatings to fluorescent UV-condensation light-water-exposure apparatus, practice for conducting tests, D 4587 (06.01)
 - lightfastness of pigments (in artists' paints), test, D 4303 (06.01)
 - lightfastness of printed matter, D 3424 (06.01)
 - operating carbon-arc light-exposure apparatus with and without water for exposure of nonmetallic materials, practice, G 23 (06.01)

- operating light-exposure apparatus (xenon-arc type) with/without water for exposure of nonmetallic materials, practice, G 26 (06.01)
- operating light-/water-exposure apparatus (fluorescent-UV condensation type) for exposure of nonmetallic materials, practice, G 53 (06.01)
- Light—lightfastness**
 - lightfastness of pigments (in artists' paints), test, D 4303 (06.01)
 - printed matter, D 3424 (06.01)
- Light—reflectance**
 - See Reflectance and reflectivity (headings)
- Light—stability**
 - clear coatings, by sunlight-through-glass method, test, D 2620 (06.01)
- Light—transmission and reflection**
 - color changes (of opaque materials), by instrumental evaluation, test, D 2244 (06.01)
 - gloss differences between surfaces of similar appearance, method for visual evaluation, D 4449 (06.01)
 - light stability of clear coatings, by sunlight-through-glass method, test, D 2620 (06.01)
- Lightening power**
 - See Tinting strength
- Lightfastness**
 - artists' acrylic emulsion paints, spec., D 5098 (06.01)
- Limestone drop test**
 - impact resistance of pipeline coatings, by limestone drop test, G 13 (06.01)
- Limiting viscosity number**
 - limiting viscosity number of cellulose acetate propionate/butyrate, test, D 817 (06.02)
- Limonite**
 - See Ocher
- Linear programmed temperature gas chromatography**
 - See Chromatography—gas (headings)
- Lining industry**
 - continuity verification of liquid/sheet linings applied to concrete substrates, practice, D 4787 (06.01)
 - design/fabrication of flue gas desulfurization system components (for protective lining application), spec., D 4618 (06.01)
 - design/use of safety alert system for hazardous work locations in coating/lining industry, practice, D 4257 (06.01)
 - inspection of linings in operating flue gas desulfurization systems, practice, D 4619 (06.01)
- Linings**
 - continuity verification of liquid/sheet linings applied to concrete substrates, practice, D 4787 (06.01)
 - protective coating/lining work for power generation facilities, terminology, D 4538 (06.01)
 - specifying inspection requirements for coating/lining work on metal substrates, guide, D 5161 (06.01)
- Linings—defects and failures**
 - photographic documentation of coatings/lining defects and failures, D 4121 (06.01)
- Linseed oil**
 - absorption (by pigments), by Gardner-Coleman method, test, D 1483 (06.02)
 - absorption (by pigments), spatula rub-out test, D 281 (06.02)
 - boiled linseed oil, spec., D 260 (06.03)
 - linseed oil, spec., D 1538 (06.03)
 - raw, foots, by gravimetric method, test, D 1966 (06.03)
 - raw, foots, by volumetric method, test, D 1954 (06.03)
 - raw linseed oil, spec., D 234 (06.03)
 - white linseed oil paints- chemical analysis, selecting test methods, practice, D 215 (06.01)

Index of ASTM Standards, Section 6

Lipids
alcohol-benzene soluble matter in cellulose, test, D 1794 (06.02)

Liquid chemicals
See Chemicals

Liquid coating properties
testing solvent-borne architectural (interior/exterior) coatings, guide, D 5146 (06.01)

Liquid cyclic products
sampling/handling liquid cyclic products (at ambient temperature), practice, D 3437 (06.03)

Liquid driers
See Driers

Liquid epoxy resins
See Resins—epoxy
epoxy content of epoxy resins, test, D 1652 (06.02)

Liquids
amount of liquid separated as upper layer from a viscous solution/dispersion containing dispersed solids, test, D 4948 (06.01)
chemical resistance of pipeline coatings, test, G 20 (06.01)
clarity/cleanliness of (nonpigmented) paint and ink liquids, by visual examination, test, D 2090 (06.02, 06.03)
color of transparent liquids, by Gardner color scale, test, D 1544 (06.01, 06.02, 06.03)
commercial density (of pure liquid chemicals), test, D 3505 (06.03)
flash/fire point of liquids, by Tag open-cup apparatus, test, D 1310 (06.03)
flash point by Tag closed tester, test, D 56 (06.03)
flash point (of fuel oils/lube oils/suspension of solids/liquids), by Pensky-Martens closed tester, test, D 93 (06.03)
liquid/solid status (of viscous materials), test, D 4359 (06.01)
oilicia oil (permanently liquid), spec., D 601 (06.03)
sustained burning (of liquid mixtures), by Seta-flash tester (open cup), test, D 4206 (06.01, 06.03)
sustained burning (of low viscosity liquid mixtures), by Wick test, D 4207 (06.03)
viscosity of transparent liquids, by bubble time method, test, D 1545 (06.01, 06.02, 06.03)

Lithium methoxide
identification of carboxylic acids in alkyd resins D 2455 (06.02)

Loading tests
pull-off strength of coatings, using portable adhesion testers, test, D 4541 (06.01)

Loading tests—metals/alloys
salt spray (fog) testing, method, B 117 (06.01)

Loss of adhesion
See Adhesion—loss of adhesion

Loss of coolant accident (LOCA) conditions
See Nuclear reactor vessels—light-water cooled

Loss on ignition
See Ignition—loss on ignition

Low concentrations (of elements)
antimony content (low concentrations) in solids of liquid coatings/dried films, by atomic absorption spectroscopy, test, D 3717 (06.01)
chromium content (low concentrations) in solids of liquid coatings/dried films, by atomic absorption spectroscopy, test, D 3718 (06.01)
lead/cadmium/cobalt content (low concentrations) in nonvolatile portion of liquid coatings/dried films, by atomic absorption spectroscopy, test, D 3335 (06.01)
mercury content (low concentrations) in liquid coatings/coatings vehicles/dried films, by atomic absorption spectroscopy, test, D 3624 (06.01)

Low hiding strontium chromate
See Strontium chromate

Low temperature bake coatings
nonvolatile content of latexes, test, D 4758 (06.02)

Marine (shipboard) coatings

Low voltage wet sponge test
discontinuity (holiday) testing of nonconductive protective coating on metallic substrates, practice, D 5162 (06.01)

Luminous reflectance
See Reflectance and reflectivity (headings)

M

Magazine covers
abrasion resistance of printed matter, by the ga-cat comprehensive abrasion test, D 5181 (06.01)

Magnesium alloys
surface preparation for painting, practice, D 1732 (06.01)

Magnesium anode method
cathodic disbonding of pipeline coatings, accelerated procedure, test, G 8 (06.01)

Magnesium carbonate
acid-insoluble extenders in (iron/copper phthalocyanine/ultramarine) blue pigments, test, D 1135 (06.02)

Magnesium oxide (MgO) content
magnesium oxide in magnesium silicate pigment, test, D 717 (06.02)

Magnesium silicate
magnesium silicate pigment (talc), spec., D 605 (06.02)

Magnesium silicate pigment
magnesium silicate pigment, analysis, test, D 717 (06.02)

Magnetic flux
film thickness of pipeline coatings on steel, nondestructive measurement, method, G 12 (06.01)

Magnetic testing
film thickness of pipeline coatings on steel, nondestructive measurement, method, G 12 (06.01)

Maintenance—coatings
assessing the condition of aged coatings on steel surfaces, guide, D 5065 (06.01)
conducting a patch test to assess coating compatibility, practice, D 5064 (06.01)
establishing procedures to monitor performance of safety related coatings in operating nuclear power plant, guide, D 5163 (06.01)

Maleic acid content
maleic acid content of maleic anhydride, by potentiometric titration, test, D 2930 (06.03)

Maleic anhydride
color in molten state/after heating, by platinum cobalt scale (includes phthalic anhydride), test, D 3366 (06.03)
maleic acid content of maleic anhydride, by potentiometric titration, test, D 2930 (06.03)
maleic anhydride, spec., D 3504 (06.03)
sampling and handling aniline, practice, D 3438 (06.03)

Mandrel bend test
mandrel bend test of attached organic coatings, test, D 522 (06.01)

Manganese
black synthetic iron oxide pigment, spec., D 769 (06.02)
liquid paint driers, selection of test methods, D 564 (06.03)
raw/burnt sienna pigments, spec., D 765 (06.02)
synthetic red iron oxide pigment, spec., D 3721 (06.02)

Manganese content
metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)
paint driers, by EDTA method, test, D 2375 (06.03)

Manufacturing processes
transfer efficiency under production conditions for spray application of automotive paints, by weight basis, practice, D 5066 (06.01)

Marine (shipboard) coatings
See Antifouling paint pigments (headings)

Index of ASTM Standards, Section 6

Mar resistance

Mar resistance

mar resistance of organic coatings, using balanced beam scrape adhesion and mar test, D 5178 (06.01)

Masonry assemblages

making and preparing concrete/masonry panels for testing paint finishes, method, D 1734 (06.01)

surface cleaning concrete unit masonry (for coating), practice, D 4261 (06.01)

Masonry water repellents

nonvolatile content in silanes/siloxanes/silane-siloxane blends used in masonry water-repellent treatments, test, D 5095 (06.01)

Material handling

impact resistance of pipeline coatings, by falling weight test, G 14 (06.01)

naphthalene, maleic/phthalic anhydride, practice, D 3438 (06.03)

phenol and cresylic acid, practice, D 3852 (06.03)

sampling and handling aniline, practice, D 3436 (06.03)

sampling/handling 4,4'-isopropylidene diphenol (bisphenol-A), practice, D 4297 (06.03)

sampling/handling liquid cyclic products (at ambient temperature), practice, D 3437 (06.03)

Matter insoluble in chloroform

chloroform insoluble matter in oiticia oil, test, D 1958 (06.03)

Mechanical damage

specific bendability of pipeline coatings, test, G 10 (06.01)

Mechanical muller

See Muller device

MEHQ content

See Methyl ether of hydroquinone (MEHQ) content

MEK (methyl ethyl ketone) resistance

See Methyl ethyl ketone (MEK)

Menhaden-derived fish oil

See Oils—drying

Mercaptans

mineral (petroleum) spirits hydrocarbon drycleaning solvent, spec., D 235 (06.03)

Mercuric oxide

analysis, D 284 (06.02)

mercuric oxide for use in antifouling paints, spec., D 911 (06.02)

Mercury content

dry mercuric oxide pigment, test, D 284 (06.02)

mercury content (low concentrations) in liquid coatings/coatings vehicles/dried films, by atomic absorption spectroscopy, test, D 3624 (06.01)

Mesityl oxide

analysis of major organic impurities in phenol produced by the cumene process, by gas chromatography, test, D 4961 (06.03)

Metallic copper content

chemical analysis of cuprous oxide/copper pigments, test, D 283 (06.02)

Metallic finishes

gloss of high-gloss metallic/nonmetallic surfaces, by goniophotometry, method, E 430 (06.01)

Metal powder pigments

See Aluminum powder and paste/Copper powder

See Gold bronze powder/Zinc dust

Metal primer

See Primer

zinc yellow (zinc chromate) pigments, spec., D 478 (06.02)

Metals and metallic materials

wet film thickness of organic coatings, D 1212 (06.01)

Metals and metallic materials—coating applications

accelerated outdoor exposure tests of coatings (applied to metal substrates), practice, D 4141 (06.01)

adhesion of coating films to metallic substrates, by tape test, D 3359 (06.01)

coil coatings, testing, practice, D 3794 (06.01)

discontinuity (holiday) testing of nonconductive protective coating on metallic substrates, practice, D 5162 (06.01)

flexibility/adhesion of organic coatings (paints) on preformed deformed metallic sheets, test, D 4145 (06.01)

gloss of high-gloss metallic/nonmetallic surfaces, by goniospectrometry, method, E 430 (06.01)

mandrel bend test of attached organic coatings, test, D 522 (06.01)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

Index of ASTM Standards, Section 6

Methyl esters

- fatty acid composition, by gas-liquid chromatography of methyl esters, test, **D 1983 (06.03)**
- preparation from oils, for fatty acid composition determination by gas-liquid chromatography, **D 2800 (06.03)**
- preparation of methyl esters from fatty acids, for fatty acid composition analysis, test, **D 3457 (06.03)**

Methyl ether of hydroquinone (MEHQ) content

- methyl ether of hydroquinone (MEHQ) content of colorless monomeric acrylate esters, test, **D 3125 (06.03)**

Methyl ethyl ketone (MEK)

- MEK resistance of ethyl silicate (inorganic) zinc-rich primers, by solvent rub, test, **D 4752 (06.01)**
- methyl ethyl ketone, spec., **D 740 (06.03)**
- purity of methyl ethyl ketone, using gas chromatography, test, **D 2804 (06.03)**

Methyl isoamyl ketone (MIAK)

- methyl isoamyl ketone, spec., **D 2917 (06.03)**
- purity of methyl (amyl ketone/isoamyl ketone), by gas chromatography, test, **D 3893 (06.03)**

Methyl isobutyl carbinol

- methyl isobutyl carbinol, spec., **D 2635 (06.03)**

Methyl isobutyl ketone (MIBK)

- methyl isobutyl ketone, spec., **D 1153 (06.03)**
- purity of methyl isobutyl ketone, by gas chromatography, test, **D 3329 (06.03)**

Methyl methacrylate

- unreacted monomer content of latexes, by gas-liquid chromatography, test, **D 4747 (06.02)**
- unreacted monomer content of latexes using capillary column gas chromatography, test, **D 4827 (06.02)**

Methylol group content

- methylol group determination (qualitative) in phenolic resins, test, **D 4706 (06.02)**

Methylstyrene

- analysis of major organic impurities in phenol produced by the cumene process, by gas chromatography, test, **D 4961 (06.03)**

Metric practice—SI (International System of Units)

- use of international system of units (SI) (modernized metric system), excerpts, (Related Material—all volumes) **(06.01, 06.02, 06.03)**

Mica pigment

- grit content of mica pigment, test, **D 716 (06.02)**
- wet ground mica pigments, spec., **D 607 (06.02)**

Microbiological attack—paints/related coatings

- discoloration susceptibility (in exterior exposure tests), practice, **D 3456 (06.01)**
- paint films, evaluating degree of surface disfigurement, **D 3274 (06.01)**
- resistance of emulsion paints (in containers) to attack by microorganisms, test, **D 2574 (06.01)**
- resistance to mold growth on surface of interior paint coatings (in an environmental chamber), test, **D 3273 (06.01)**

Microbiological examination

- presence of and removing microbial (fungal/algal) growth on paint/related coatings, guide, **D 4610 (06.01)**

Microcoulometry

- See Coulometry—microcoulometry

Microelectronic device processing—water

- reagent water, spec., **D 1193 (06.03)**

Micrometer

- disbonding characteristics of pipeline coatings, by direct soil burial, test, **G 19 (06.01)**
- dry-film thickness of organic coatings, using micrometers, test, **D 1005 (06.01)**
- penetration resistance of pipeline coatings, by blunt rod test, **G 17 (06.01)**

Moisture content—paints/related coatings/materials

Microscopic examination—paints/related coatings

- dry film thickness of protective coating systems, by destructive means, test, **D 4138 (06.01)**
- reporting particle size characteristics of pigments, practice, **D 1366 (06.02)**

Microwave procedures

- laboratory preparation of gelled vehicles using microwave oven, practice, **D 5166 (06.02)**

Migration

- plasticizer migration from vinyl fabrics to lacquers, method, **D 2199 (06.01)**

Milliequivalency

- acid/base milliequivalent content of (anodic/cathodic) electrocoat baths/their ultrafiltrates, test, **D 4370 (06.01)**

Milori blue

- See Iron blue

Minerals

- field identification of coatings, test, **D 5043 (06.01)**

Mineral spirits

- aromatics (ethylbenzene and eight-carbon (C₈/heavier) content in mineral spirits, by gas chromatography, test, **D 3257 (06.03)**
- mineral (petroleum) spirits hydrocarbon drycleaning solvent, spec., **D 235 (06.03)**
- porosity of paint films (to indicate coating penetration), test, **D 3258 (06.01)**

Miniature sandmill method

- color and strength of color pigments, **D 3022 (06.02)**

Minimum film formation (of paints)

- See Film—formation rates

Minimum film formation temperature (MFFT)

- minimum film formation temperature (MFFT) of emulsion vehicles, test, **D 2354 (06.02)**

Miscibility

- heptane miscibility of lacquer solvents, test, **D 1476 (06.03)**
- water miscibility of water-soluble solvents, test, **D 1722 (06.03)**

Mixed aniline point

- sampling and testing dipentene, method, **D 801 (06.03)**

Mixed xylene

- See Xylene (mixed)

MMFT

- See Film

Model 'C' wet film thickness gage

- wet film thickness of organic coatings, **D 1212 (06.01)**

Modified Wolfe-potentiometric method

- See Wolfe-potentiometric method

Moisture analysis—wood products

- edge performance of composite wood products under surfactant accelerated moisture stress, test, **D 2065 (06.01)**

Moisture content—paints/related coatings/materials

- calcium borosilicate, test, **D 4487 (06.02)**
- capillary moisture in concrete, by plastic sheet method, test, **D 4263 (06.01)**
- cellulose acetate propionates/butyrate, test, **D 817 (06.02)**
- cellulose acetate, test, **D 871 (06.02)**
- ethylcellulose, test, **D 914 (06.02)**
- hydrogen sulfide/sulfur dioxide (qualitative) of industrial aromatic hydrocarbons, test, **D 2363 (06.02)**
- hydroxyethylcellulose, test, **D 2364 (06.02)**
- hygroscopic moisture (and other matter volatile under test conditions) in pigments, test, **D 280 (06.02)**
- methylcellulose, test, **D 1347 (06.02)**
- moisture content of (iron/copper phthalocyanine/ultramarine) blue pigments, by Brabender test, **D 1135 (06.02)**
- moisture in cellulose, test, **D 1348 (06.02)**
- pentaerythritol (for manufacture of alkyd/other synthetic resins), tests, **D 2195 (06.03)**
- pine tars and pine tar oils, test, **D 856 (06.03)**
- sampling and testing dipentene, method, **D 801 (06.03)**

Index of ASTM Standards, Section 6

Moisture content—paints/related coatings/materials

- sampling/testing lac resins (orange shellac/button-lac/garnet lac/bleached lac), test, D 29 (06.02)
- sodium glycolate content of sodium carboxymethylcellulose, test, D 1439 (06.02)
- tall oil, methods of testing, D 803 (06.03)
- water content of paints/paint materials, by Karl Fischer method, test, D 4017 (06.01)
- water in liquid naval stores, test, D 890 (06.03)
- Moisture degradation**
 - conducting tests on paint/varnish/lacquer/related products, using enclosed carbon-arc light/water exposure apparatus, practice, D 5031 (06.01)
- Moisture passage**
 - water penetration into pipeline coatings, test, G 9 (06.01)
- Moisture vapor permeability**
 - moisture vapor transmission of organic coating films, test, D 1653 (06.01)
- Molar substitution (MS)**
 - hydroxyethylcellulose, test, D 2364 (06.02)
- Molecular weight—average**
 - acid/amine value of fatty quaternary ammonium chlorides, test, D 2080 (06.03)
- Molybdate pigment**
 - molybdate orange pigments, spec., D 2218 (06.02)
 - yellow/orange/green pigments containing lead chromate/chromium oxide green, analysis, test, D 126 (06.02)
- Molybdenum content**
 - molybdate orange pigments, spec., D 2218 (06.02)
 - yellow/orange/green pigments containing lead chromate/chromium oxide green, analysis, test, D 126 (06.02)
- Monocyclic aromatic hydrocarbons**
 - See Hydrocarbons (headings)
- Monocyclic terpene hydrocarbons**
 - See Dipentene (and related terpene solvents) (headings)
- Monomeric acrylate esters (colorless)**
 - methyl ether of hydroquinone (MEHQ) content of colorless monomeric acrylate esters, test, D 3125 (06.03)
- Monomers**
 - unreacted monomer content of latexes, by gas-liquid chromatography, test, D 4747 (06.02)
 - water content of paints/paint materials, by Karl Fischer method, test, D 4017 (06.01)
- Monomer (unreacted)**
 - unreacted monomer content of latexes using capillary column gas chromatography, test, D 4827 (06.02)
- Monopentaerythritol content**
 - monopentaerythritol in commercial pentaerythritol, by gas chromatography/dibenzal methods, test, D 2195 (06.03)
- Mortar resistance**
 - acid/mortar resistance of factory-applied clear coatings on extruded aluminum products, test, D 3260 (06.01)
- Mottling**
 - pressure mottling/blocking resistance of organic coatings (on metal substrates), test, D 3003 (06.01)
 - reporting paint film failures characteristic of exterior latex paints, classification, D 1848 (06.01)
- Mud-cracking**
 - reporting paint film failures characteristic of exterior latex paints, classification, D 1848 (06.01)
- Muffle furnace**
 - nonvolatile and pigment content of electrocoat baths, using muffle furnace, test, D 5145 (06.01)
- Muffle-furnace technique**
 - chemical/gravimetric analysis of white/yellow thermoplastic traffic marking material containing lead chromate and titanium dioxide, test, D 4797 (06.01)
- Muller device**
 - color/tinting strength (of dry colored pigments/pastes in oil), test, D 387 (06.02)

Multinotch applicator

- sag resistance of paints, using a multinotch applicator, test, D 4400 (06.01)
- wet film thickness of organic coatings, by notched bar method, practice, D 4414 (06.01)
- Multipanel forms**
 - recording results on single-/multi-panel forms, method, test, D 1150 (06.01)

N

Naphtha and naphtha derivatives

- acidity of benzene/toluene/xylenes/solvent naphtha/aromatic industrial aromatic hydrocarbons, test, D 847 (06.03)
- acid wash color of industrial aromatic hydrocarbons, test, D 848 (06.03)
- aromatic hydrocarbons/related chemicals, terminology, D 4790 (06.03)
- evaporation residue determination, test, D 2232 (06.03)
- high-flash aromatic naphthas, spec., D 3734 (06.03)
- sampling and handling aniline, practice, D 3438 (06.03)
- VM & P naphthas, spec., D 3735 (06.03)
- water content, by iodine reagent method, test, D 1631 (06.03)

Natural drying oils

See Oils—drying

Natural iron oxide pigments

See Iron oxide black

Natural pigments

- iron oxide black (natural)- chemical analysis, test, D 3872 (06.02)
- natural red/brown iron oxide pigments, spec., D 3722 (06.02)
- pure para red toner pigment, spec., D 475 (06.02)
- pure toluidine red toner, spec., D 656 (06.02)

Natural pine oil

See Oils—pine (natural/synthetic)

Natural yellow oxide

See Ocher

Naval stores

- naval stores/related products, def. of terms, D 804 (06.03)
- volatile/nonvolatile content (of driers/drying oils/naval stores and solvents), selecting test procedures, guide, D 4140 (06.03)
- water in liquid naval stores, test, D 890 (06.03)

Negative Beilstein

- field identification of coatings, test, D 5043 (06.01)

Neutral salt spray test

See Salt spray (fog) testing

Newtonian liquids

- viscosity of paints/varnishes/lacquers, by Ford viscosity cup, test, D 1200 (06.01)
- viscosity of printing inks/vehicles, by falling-rod viscometer, test, D 4040 (06.01)

Nitration grade/pure benzene/benzol

See Benzene

Nitration grade/pure toluene/toluol

See Toluene

Nitration grade xylene

See Xylene (nitration grade)

Nitrobenzene

- nitrobenzene in aniline, test, D 4589 (06.03)

Nitrocellulose

See Cellulose and cellulose derivatives (headings)

Nitrogen-containing plastics

- nitrogen (total) content of nitrogen-containing plastics/resins/resin solutions, test, D 1013 (06.02)

Nitrogen content

- nitrogen (total) content of nitrogen-containing plastics/resins/resin solutions, test, D 1013 (06.02)
- soluble cellulose nitrate, testing, methods, D 301 (06.02)

Index of ASTM Standards, Section 6

- soluble nitrocellulose, by ferrous sulfate procedure, test, **D 4795 (06.02)**
- Nitrogen impurities**
 - pyridine base content in cresylic acid, by direct titration, test, **D 4471 (06.03)**
- Nonamine component content**
 - non-amine component content of fatty amines/nonamines, test, **D 2082 (06.03)**
- Nonaromatic hydrocarbons**
 - See Hydrocarbons (headings)*
 - aromatic hydrocarbons/related chemicals, terminology, **D 4790 (06.03)**
 - impurities in high-purity ethylbenzene, by gas chromatography, test, **D 5060 (06.03)**
 - total non-aromatic/trace monocyclic hydrocarbon aromatic hydrocarbons in high-purity benzene/toluene/mixed xylenes, by gas chromatography, test, **D 2360 (06.03)**
 - xylene isomer analysis, by gas chromatography, test, **D 2306 (06.03)**
- Nonaromatic impurities**
 - chemical analysis of benzene, by gas chromatography, test, **D 4492 (06.03)**
- Nonconductive coatings**
 - dry film thickness of nonconductive coatings (applied to nonferrous metal base), nondestructive measurement, test, **D 1400 (06.01)**
- Nonconductive linings**
 - continuity verification of liquid/sheet linings applied to concrete substrates, practice, **D 4787 (06.01)**
- Nonconductive protective coatings**
 - discontinuity (holiday) testing of nonconductive protective coating on metallic substrates, practice, **D 5162 (06.01)**
- Nonconjugated oils—iodine value**
 - See Iodine value*
- Noncontact thermometer**
 - temperature of applied coatings on wood products during the curing cycle, by infrared radiation thermometers, practice, **D 3259 (06.01)**
- Nondestructive evaluation (NDE)**
 - effects of outdoor weathering on pipeline coatings, test, **G 11 (06.01)**
 - film thickness of pipeline coatings on steel, nondestructive measurement, method, **G 12 (06.01)**
- Nondestructive evaluation (NDE)—x-ray diffraction**
 - See X-ray diffraction*
- Nonheat-reactive resins**
 - See Resins (headings)*
- Non-human control—algae**
 - See Algae*
- Nonleafing aluminum pigment**
 - See Aluminum powder and paste*
- Nonmagnetic coatings**
 - film thickness of pipeline coatings on steel, nondestructive measurement, method, **G 12 (06.01)**
- Nonmagnetic organic coatings**
 - dry-film thickness of organic coatings, using micrometers, test, **D 1005 (06.01)**
- Nonmetallic materials**
 - accelerated testing of paints/varnishes/lacquers/related products, using filtered open flame carbon-arc light/water exposure apparatus, practice, **D 822 (06.01)**
 - disbonding characteristics of pipeline coatings, by direct soil burial, test, **G 19 (06.01)**
 - gloss of high-gloss metallic/nonmetallic surfaces, by goniophotometry, method, **E 430 (06.01)**
 - operating carbon-arc light-exposure apparatus with and without water for exposure of nonmetallic materials, practice, **G 23 (06.01)**
- Nuclear reactor vessels—coatings applications**
 - operating light-exposure apparatus (xenon-arc type) with/without water for exposure of nonmetallic materials, practice, **G 26 (06.01)**
 - operating light/water-exposure apparatus (fluorescent-UV condensation type) for exposure of nonmetallic materials, practice, **G 53 (06.01)**
 - penetration resistance of pipeline coatings, by blunt rod test, **G 17 (06.01)**
- Non-Newtonian coatings**
 - laboratory preparation of gelled vehicles, using microwave oven, practice, **D 5166 (06.02)**
 - rheological properties of non-Newtonian materials, by rotational (Brookfield) viscometer, test, **D 2196 (06.01)**
 - viscosity of paints/varnishes/lacquers, by Ford viscosity cup, test, **D 1200 (06.01)**
 - viscosity of printing inks/vehicles, by falling-rod viscometer, test, **D 4040 (06.01)**
- Nonvolatile matter content—paints/related coatings/materials**
 - acid/amine value of fatty quaternary ammonium chlorides, test, **D 2079 (06.03)**
 - acid/base milliequivalent content of (anodic/cathodic) electrocoat baths/their ultrafiltrates, test, **D 4370 (06.01)**
 - cellulosics/emulsions/resin solutions/shellac/varnishes, selecting test procedures, practice, **D 4209 (06.02)**
 - driers/drying oils/naval stores and solvents, selecting test procedures, guide, **D 4140 (06.03)**
 - nonvolatile and pigment content of electrocoat baths, using muffle furnace, test, **D 5145 (06.01)**
 - nonvolatile content in silanes/siloxanes/silane-siloxane blends used in masonry water-repellent treatments, test, **D 5095 (06.01)**
 - nonvolatile content of latexes, test, **D 4758 (06.02)**
 - nonvolatile content of resin solutions (in volatile organic solvents), test, **D 1259 (06.02)**
 - printing inks/resin solutions/vehicles, test, **D 4713 (06.01)**
 - sampling and testing shellac varnish, **D 1650 (06.02)**
 - sampling/testing flaked aluminum powders/pastes, methods, **D 480 (06.03)**
 - varnishes, test, **D 1644 (06.01)**
 - volatile/nonvolatile content of paint/related coatings, selection and use of test procedures, guide, **D 2832 (06.01)**
 - volatile/nonvolatile content (of pigments), selecting test procedures, guide, **D 4139 (06.02)**
 - volatile organic compounds (VOC) of solvent reducible paints in aerosol cans, test, **D 5200 (06.01)**
 - volatile solvents, test, **D 1353 (06.03)**
 - volume nonvolatile matter in clear/pigmented coatings, test, **D 2697 (06.01)**
 - weight percent of solids in aqueous slurries of titanium dioxide pigments, test, **D 3926 (06.02)**
- Notches**
 - sag resistance of paints, using a multinotch applicator, test, **D 4400 (06.01)**
 - wet film thickness of organic coatings, by notched gages, practice, **D 4414 (06.01)**
- NPRI method**
 - fineness of grind of printing inks, by NPRI method, test, **D 1316 (06.01)**
- Nuclear paints/related coatings**
 - dry film thickness of protective coating systems, by destructive means, test, **D 4138 (06.01)**
 - photographic documentation of coatings/lining defects and failures, **D 4121 (06.01)**
 - protective coating/lining work for power generation facilities, terminology, **D 4538 (06.01)**
- Nuclear reactor vessels—coatings applications**
 - abrading concrete, practice, **D 4259 (06.01)**
 - acid etching concrete, practice, **D 4260 (06.01)**
 - capillary moisture in concrete, by plastic sheet method, test, **D 4263 (06.01)**

Index of ASTM Standards, Section 6

Nuclear reactor vessels—coatings applications

- coatings for light-water cooled nuclear power plants, D 3912 (06.01)
 - decontaminability of coatings used in light-water nuclear power plants, test, D 4256 (06.01)
 - design/fabrication of flue gas desulfurization system components (for protective lining application), spec., D 4618 (06.01)
 - design/use of safety alert system for hazardous work locations in coating/lining industry, practice, D 4257 (06.01)
 - dry film thickness of protective coating systems, by destructive means, test, D 4138 (06.01)
 - effects of radiation on coatings (for light-water nuclear power plants), test, D 4082 (06.01)
 - establishing procedures to monitor performance of safety related coatings in operating nuclear power plant, guide, D 5163 (06.01)
 - inspection of linings in operating flue gas desulfurization systems, practice, D 4619 (06.01)
 - oil/water presence in compressed air (used for coating application/air blast cleaning/abrasive blast cleaning), D 4285 (06.01)
 - pH of chemically cleaned/etched concrete surfaces, D 4262 (06.01)
 - photographic documentation of coatings/lining defects and failures, D 4121 (06.01)
 - purity of methyl isobutyl ketone, by gas chromatography, test, D 3911 (06.01)
 - quality assurance, practice, D 3843 (06.01)
 - sample preparation for qualification testing of coatings (used in nuclear power facilities), spec., D 5139 (06.01)
 - selecting test methods, guide for, D 3842 (06.01)
 - specifying inspection requirements for coating/lining work on metal substrates, guide, D 5161 (06.01)
 - surface cleaning concrete (for coating), practice, D 4258 (06.01)
 - surface cleaning concrete unit masonry (for coating), practice, D 4261 (06.01)
 - use of protective coating standards in nuclear power plants, selecting ASTM standards, guide, D 5144 (06.01)
- Nuclear reactor vessels—qualifications for painters**
- coating contractor qualification (for nuclear-powered generation facilities), practice, D 4286 (06.01)
 - establishing procedures to qualify/certify inspection personnel for coating work in nuclear facilities, guide, D 4537 (06.01)
 - qualification of journeyman painters for application of coatings to concrete surfaces of safety-related areas in nuclear facilities, practice, D 4227 (06.01)
 - qualification of journeyman painters for application of coatings to steel surfaces of safety-related areas in nuclear facilities, practice, D 4228 (06.01)

O

- Ocher**
 - chemical analysis of yellow/orange/red/brown pigments containing iron/manganese, test, D 50 (06.02)
 - ochre pigment, spec., D 85 (06.02)
- n-Octane**
 - purity of hydrocarbons from freezing points, test, D 1016 (06.03)
- Odor**
 - field identification of coatings, test, D 5043 (06.01)
 - unreacted monomer content of latexes, by gas-liquid chromatography, test, D 4747 (06.02)
 - volatile solvents and diluents, test, D 1296 (06.03)
- Oil absorption**
 - calcium borosilicate, test, D 4487 (06.02)
 - pigments, by Gardner-Coleman method, test, D 1483 (06.02)
 - pigments, by spatula rub-out test, D 281 (06.02)
- Oil acids**
 - identification of oils and oil acids in solvent-reducible paints, test D 2245 (06.03)

- Oil-base paints**
 - See Solvent-reducible paints/coatings
- Oil content**
 - artists' paints (oil/resin-oil/alkyd), spec., D 4302 (06.01)
 - oil/water presence in compressed air (used for coating application/air blast cleaning/abrasive blast cleaning), D 4285 (06.01)
- Oil resistance**
 - wood furniture lacquers, test, D 2571 (06.01)
- Oils**
 - See Hydraulic fluids**
 - coconut oil, spec., D 1841 (06.03)
 - corn oil, spec., D 1842 (06.03)
 - cottonseed oil, spec., D 1843 (06.03)
 - fish oil content (of drying oils and their fatty acids), gas-liquid chromatography, test, D 3725 (06.03)
 - identification of oils and oil acids in solvent-reducible paints, test D 2245 (06.03)
 - rosin oils, testing, D 1131 (06.03)
 - safflower oil, spec., D 1392 (06.03)
 - sunflower oil (once-refined, technical grade), spec., D 3169 (06.03)
 - water in liquid naval stores, test, D 890 (06.03)
- Oils—castor**
 - dehydrated castor oil, spec., D 961 (06.03)
 - hydroxyl value of fatty oils/acids, test, D 1957 (06.03)
 - raw castor oil, spec., D 960 (06.03)
 - spectrophotometric diene value of dehydrated castor oil/derivatives, test, D 1358 (06.03)
- Oils—drying**
 - acetone tolerance of heat-bodied drying oils, test, D 1950 (06.03)
 - ash content, test, D 1951 (06.03)
 - boiled linseed oil, spec., D 260 (06.03)
 - break, test, D 1952 (06.03)
 - color after heating, test, D 1967 (06.03)
 - color of transparent liquids, by Gardner color scale, test, D 1544 (06.01, 06.02, 06.03)
 - degummed soybean oil, spec., D 124 (06.03)
 - dehydrated castor oil, spec., D 961 (06.03)
 - drying oils, selecting test methods, guide, D 555 (06.03)
 - film formation rates in drying or curing process, at room temperature, test, D 1640 (06.01)
 - fish oil content, by gas-liquid chromatography, test, D 3725 (06.03)
 - foots, by gravimetric method, test, D 1966 (06.03)
 - foots, by volumetric method, test, D 1954 (06.03)
 - gel time, test, D 1955 (06.03)
 - iodine value, test, D 1959 (06.03)
 - loss on heating of drying oils, test, D 1960 (06.03)
 - methyl esters, preparation for fatty acid composition analysis by gas-liquid chromatography, D 2800 (06.03)
 - oilicia oil (permanently liquid), spec., D 601 (06.03)
 - raw castor oil, spec., D 960 (06.03)
 - raw linseed oil, spec., D 234 (06.03)
 - raw tung oil, spec., D 12 (06.03)
 - refined soybean oil, spec., D 1462 (06.03)
 - safflower oil, spec., D 1392 (06.03)
 - sampling liquid oils/fatty acids (commonly used in paints/varnishes/related materials), test, D 1466 (06.03)
 - saponification value of drying oils/fatty acids/polymerized fatty acids, test, D 1962 (06.03)
 - specific gravity at 25/25°C, test, D 1963 (06.03)
 - unsaponifiable matter in drying oils/fatty acids/polymerized fatty acids, test, D 1965 (06.03)
 - volatile/nonvolatile content (of driers/drying oils/naval stores and solvents), selecting test procedures, guide, D 4140 (06.03)
- Oils—fatty**
 - clarity/cleaness of (nonpigmented) paint and ink liquids, by visual examination, test, D 2090 (06.02, 06.03)

- Oils—fuel**
flash point (of fuel oils/lube oils/suspension of solids/liquids), by Pensky-Martens closed tester, test, D 93 (06.03)
- Oils—linseed**
white linseed oil paints—chemical analysis, selecting test methods, practice, D 215 (06.01)
- Oils—lubricating**
flash point (of fuel oils/lube oils/suspension of solids/liquids), by Pensky-Martens closed tester, test, D 93 (06.03)
- Oils—mineral**
mineral oil content, of rosin oil, test, D 1131 (06.03)
mineral (petroleum) spirits hydrocarbon drycleaning solvent, spec., D 235 (06.03)
- Oils—officia**
chloroform insoluble matter in officia oil, test, D 1958 (06.03)
gel time, test, D 1955 (06.03)
officia oil (permanently liquid), spec., D 601 (06.03)
- Oils—pine (natural/synthetic)**
sampling and testing pine oil, method, D 802 (06.03)
sampling/testing pine tars/pine-tar oils, test, D 856 (06.03)
water in liquid naval stores, test, D 890 (06.03)
- Oils—soybean**
degummed soybean oil, spec., D 124 (06.03)
refined soybean oil, spec., D 1462 (06.03)
- Oils—tall**
distilled fatty acids, spec., D 1984 (06.03)
tall oil, methods of testing, D 803 (06.03)
- Oils—tall oil rosin**
oleic acid content of tall oil rosin, test, D 1585 (06.03)
volatile resin acids in tall oil/gum/wood rosin, by gas chromatography, test, D 3008 (06.03)
- Oils—tung**
gel time, test, D 1955 (06.03)
quality determination, test, D 1964 (06.03)
raw castor oil, spec., D 12 (06.03)
- Oily matter content**
sampling/testing flaked aluminum powders/pastes, methods, D 480 (06.03)
- Oleic acid content**
oleic acid content of tall oil rosin, test, D 1585 (06.03)
- Once-refined sunflower oil (technical-grade)**
sunflower oil (once-refined, technical grade), spec., D 3169 (06.03)
- Opacity**
hiding power of architectural paints applied by roller, test, D 5150 (06.01)
- Opacity/opaque materials**
directional reflectance factor (45-deg 0-deg) of opaque specimens, by broad-band filter reflectometry, test, E 97 (06.01)
testing industrial water-reducible coatings, guide, D 4712 (06.01)
- Open-cup flash point methods**

Hiding power/Luminance/Metamerism
Reflectance and reflectivity
Refractive index/Tinting strength
printing inks/ink films/related materials, selecting test methods, guide, D 5010 (06.01)
- Orange pigments**
chrome yellow/orange pigment, spec., D 211 (06.02)
molybdate orange pigments, spec., D 2218 (06.02)
yellow/orange/green pigments containing lead chromate/chromium oxide green, analysis, test, D 126 (06.02)
- Orange shellac**
See Shellac
- Organic coatings**
abrasion resistance, by Taber abraser, test, D 4060 (06.01)
acid value of organic coating materials, test, D 1639 (06.01)
adhesion of organic coatings to plastic substrates, by direct tensile testing, D 5179 (06.01)
adhesion, to smooth panel surfaces, by scrape test, D 2197 (06.01)
clear/pigmented organic coatings, test, D 1308 (06.01)
conducting tests on paint/varnish/lacquer/related products, using enclosed carbon-arc light/water exposure apparatus, practice, D 5031 (06.01)
detergent resistance, practice, D 2248 (06.01)
dry-film thickness of organic coatings, using micrometers, test, D 1005 (06.01)
dry film thickness of protective coating systems, by destructive means, test, D 4138 (06.01)
effect of staining agents, for products in the transportation industry, practice, D 1540 (06.01)
effects of overbaking on organic coatings, practice, D 2454 (06.01)
evaluating (interior/exterior) coatings for protecting steel surfaces at high-temperature service, test, D 2485 (06.01)
exposure of paints/related coatings to fluorescent UV-condensation light-water-exposure apparatus, practice for conducting tests, D 4587 (06.01)
filiform corrosion resistance, test, D 2803 (06.01)
film formation rates in drying or curing process, test, D 1640 (06.01)
film hardness, by pencil test, D 3363 (06.01)
flexibility/adhesion of organic coatings (paints) on prepainted deformed metallic sheets, test, D 4145 (06.01)
formability (of attached coatings), with impact-wedge bend apparatus, test, D 3281 (06.01)
hardness of organic coatings, by König/Pendulum hardness tests, D 4366 (06.01)
mandrel bend test of attached organic coatings, test, D 522 (06.01)
moisture vapor transmission of organic coating films, test, D 1653 (06.01)
practical washability of organic coatings, test, D 4828 (06.01)
preparation of free films of organic coatings, practice, D 4708 (06.01)
producing films of uniform thickness of paint/varnish/related products on test panels, test, D 823 (06.01)
resistance of organic coatings to effects of rapid deformation (impact), test, D 2794 (06.01)
resistance to pressure mottling and blocking, test, D 3003 (06.01)
silicon content of silicone polymers and silicone-modified alkyds, by atomic absorption spectrophotometry, test, D 3733 (06.02)
testing finishes on primed metallic substrates for humidity-thermal cycle cracking, method, D 2246 (06.01)
testing water resistance of coatings, using water fog apparatus, practice, D 1735 (06.01)
water immersion test, D 870 (06.01)
wet film thickness of organic coatings, D 1212 (06.01)
wet film thickness of organic coatings, by notched gages, practice, D 4414 (06.01)
- Organic compounds**
acrylic acid dimer in acrylic acid/unsaturated organic acids, test, D 4415 (06.03)
alcohol-benzene soluble matter in cellulose, test, D 1794 (06.02)
amount of volatile organic compound (VOC) released from solventborne automotive coatings and available for removal in a VOC control device (abatement), test, D 5087 (06.01)
sampling industrial chemicals, practice, E 300 (06.03)
trace peroxides (≥ 5 -80 ppm), using spectrophotometer, test, E 299 (06.03)
- Organic linings**
inspection of linings in operating flue gas desulfurization systems, practice, D 4619 (06.01)

Index of ASTM Standards, Section 6

Organic liquids (volatile)

Organic liquids (volatile)

See Volatile organic compounds (VOC)

Organic matter content

volatile organic content (VOC) of paints/related coatings, selecting test procedures, practice, D 3960 (06.01)

Organic solvents

See Solvents

Organotin

organotin release rates of antifouling coating systems in sea water, using graphite furnace atomic absorption spectrophotometry (GF-AAS), test, D 5108 (06.01)

Orpiment content

sampling/testing lac resins (orange shellac/button lac/garnet lac/bleached lac), test, D 29 (06.02)

Orthoxylene

See ortho-Xylene

Outdoor weathering

See Weathering—outdoor

Ovens

nonvolatile content of printing inks/resin solutions/vehicles, test, D 4713 (06.01)

Overbaking (of paints/related coatings)

effects of overbaking on organic coatings, practice, D 2454 (06.01)

Oxidative microcoulometry

sulfur (trace quantities) in liquid aromatic hydrocarbons, by oxidative microcoulometry, test, D 3961 (06.03)

Oxirane

epoxy content of epoxy resins, test, D 1652 (06.02)

Oxygen (active) content

See Active oxygen content

Oxygen degradation

conducting tests on paint/varnish/lacquer/related products, using enclosed carbon-arc light/water exposure apparatus, practice, D 5031 (06.01)

exposure of paints/related coatings to fluorescent UV-condensation light-water-exposure apparatus, practice for conducting tests, D 4587 (06.01)

P

Package stability

estimating package stability of coatings for ultraviolet curing, test, D 4144 (06.01)

freeze-thaw resistance of water-borne coatings, test, D 2243 (06.01)

package stability of solvent-reducible/water-reducible paint, test, D 1849 (06.01)

resistance of emulsion paints (in containers) to attack by microorganisms, test, D 2574 (06.01)

sampling liquid paints/related pigmented coatings, practice, D 3925 (06.01)

Packaging and packaging materials

abrasion resistance of printed matter, by the ga-cat comprehensive abrasion test, D 5181 (06.01)

Paint—architectural

See Architectural coatings

Paint—automotive

See Automotive coatings/paints

Paint—chromatic

See Chromate coatings

Paint—curing

See Curing characteristics

Paint—general

acidity in volatile solvents/chemical intermediates (used in paint/varnish/lacquer/related products), test, D 1613 (06.03)

clear/pigmented organic coatings, test, D 1308 (06.01)

conducting tests on paint/varnish/lacquer/related products, using enclosed carbon-arc light/water exposure apparatus, practice, D 5031 (06.01)

dichloromethane/1,1,1-trichloroethane content in paints/coatings, by direct injection gas chromatography, test, D 4457 (06.01)

directional reflectance factor (45-deg 0-deg) of opaque specimens, by broad-band filter/reflectometry, test, E 97 (06.01)

dry-film thickness of organic coatings, using micrometers, test, D 1005 (06.01)

erosion testing of antifouling paints, using high velocity water, test, D 4938 (06.01)

evaluating degree of settling (pigment suspension/ease of remixing a shelf-aged sample) of paint, test, D 869 (06.01)

evaluating (interior/exterior) coatings for protecting steel surfaces at high-temperature service, test, D 2485 (06.01)

field identification of coatings, test, D 5043 (06.01)

fire retardancy of paints, by cabinet method, test, D 1360 (06.01)

flash/fire point of liquids, by Tag open-cup apparatus, test, D 1310 (06.03)

flash point by Tag closed tester, test, D 56 (06.03)

index of ASTM methods equivalent/related to methods in Federal Standard 141 ("Paint, Varnish, Lacquer, and Related Materials; Methods for Sampling and Testing"), (Related Material) (06.01, 06.02, 06.03)

index of standards by ISO/TC 35 on Paint and Varnishes, (Related Material) (06.01, 06.02, 06.03)

paint/varnish/lacquer/related products, terminology, D 16 (06.01, 06.02, 06.03)

preparation of free films of organic coatings, practice, D 4708 (06.01)

recording results on single-/multi-panel forms, method, D 1150 (06.01)

small-scale evaluation of fire-retardant paints, by 2-foot tunnel method, test, D 3806 (06.01)

standard environments for conditioning/testing paint/varnish/lacquer/related materials, spec., D 3924 (06.01)

titanium dioxide content in paint, by x-ray fluorescence spectroscopy, test, D 4764 (06.01)

wet film thickness of organic coatings, D 1212 (06.01)

Paint—industrial water-base

pigment content, by low temperature ashing, test, D 3723 (06.01)

testing industrial water-reducible coatings, guide, D 4712 (06.01)

testing water resistance of coatings at 100 % relative humidity, practice, D 2247 (06.01)

water content of water-reducible paints, by direct injection into gas chromatograph, test, D 3792 (06.01)

Paint—inspectors

See Qualifications

painting inspectors (metal substrates), guide, D 3276 (06.01)

Paint—latex

See Latex paints

Paint—primer

See Primer

Paint—selection/use of test procedures

See Guides for testing paints/related coatings/materials

Paint—solvent-reducible

See Solvent-reducible paints/coatings

Paint—thinners

ester value of solvents and thinners, test, D 1617 (06.03)

evaporation rate, test, D 3539 (06.01)

nature of thinners in solvent-reducible paints, qualitative determination, method, D 2349 (06.01)

Paint brushes

preparation of paint brushes for evaluation, practice, D 5068 (06.01)

- Paint roller**
preparation of paint roller covers for evaluation, D 5069 (06.01)
- Paint spatter resistance**
paint spatter resistance to roller application, test, D 4707 (06.01)
- Paint test results**
recording results on single-/multi-panel forms, method, D 1150 (06.01)
- Pale gold bronze**
See Gold bronze powder
- Panel evaluation**
evaluation of painted/coated specimens subjected to corrosive environments, method, D 1654 (06.01)
mandrel bend test of attached organic coatings, test, D 522 (06.01)
- Panel forms**
recording results on single-/multi-panel forms, method, D 1150 (06.01)
- Panels**
wood used as panels in weathering tests of coatings, spec., D 358 (06.01)
- Paper and paperboard**
directional reflectance factor (45-deg 0-deg) of opaque specimens, by broad-band filter reflectometry, test, E 97 (06.01)
lightfastness of printed matter, D 3424 (06.01)
- Para (paranitraniline) red**
See Pigments (general properties)
pure para red toner pigment, spec., D 475 (06.02)
- Para red pigment**
para red/toluidine red pigments, testing, D 970 (06.02)
- Paraxylene**
See para-Xylene
- Paris red**
See Red lead
- Paris white**
See Calcium carbonate
- Paris yellow**
See Chrome yellow and orange
- Particle size (analysis/distribution)**
chemical analysis of calcium borosilicate, test, D 4487 (06.02)
coarse particles in pigments/pastes/paints, test, D 185 (06.01, 06.02)
multicolor lacquers, test, D 2338 (06.01)
polymeric powder properties, by multiple sieve method, practice, D 3451 (06.01)
reporting particle size characteristics of pigments, practice, D 1366 (06.02)
- Particle size (analysis/distribution)—distribution**
particle size distribution, by hydrometer of common white extender pigments, test, D 3360 (06.02)
- Paste**
coarse particles in pigments/pastes/paints, test, D 185 (06.01, 06.02)
- Pastes in oil (of pigments)**
See Pigment dispersions (paint)—white pigment analysis
- Patches**
comparative corrosion preventive characteristics of materials used for joints/couplings/fittings/patches in pipeline coatings, test, G 18 (06.01)
- Patch test**
conducting a patch test to assess coating compatibility, practice, D 5064 (06.01)
- Pavement marking paint**
See Traffic paint
- Peen plating**
See Coatings—mechanically deposited
- Pencil test**
film hardness of organic coatings, test, D 3363 (06.01)
- Pendulum test**
hardness of organic coatings, by König/Persoz pendulum hardness tests, D 4366 (06.01)
- Penetration—paint film**
porosity of paint films (to indicate coating penetration), test, D 3258 (06.01)
- Penetration—pipeline coatings**
impact resistance of pipeline coatings, by falling weight test, G 14 (06.01)
penetration resistance of pipeline coatings, by blunt rod test, G 17 (06.01)
- Pensky-Martens closed tester**
See Flash point (headings)
flash point (of fuel oils/lube oils/suspension of solids/liquids), by Pensky-Martens closed tester, test, D 93 (06.03)
- Pentaerythritol**
glycerol/ethylene glycol/pentaerythritol in alkyd resins, test, D 1615 (06.02)
pentaerythritol (for manufacture of alkyd/other synthetic resins), tests, D 2195 (06.03)
- Pentane**
purity of hydrocarbons from freezing points, test, D 1016 (06.03)
- Pentosans content**
pentosans content of cellulose, test, D 1787 (06.02)
- Percent dilutability**
resin solution dilutability, test, D 5062 (06.03)
- Percent epoxide**
epoxy content of epoxy resins, test, D 1652 (06.02)
- Performance—coatings**
clear floor sealers, D 1546 (06.01)
establishing procedures to monitor performance of safety related coatings in operating nuclear power plant, guide, D 5163 (06.01)
subjecting marine antifouling coating to bifouling and fluid shear forces in natural seawater, test, D 4939 (06.01)
- Performance—nuclear materials/applications**
establishing procedures to monitor performance of safety related coatings in operating nuclear power plant, guide, D 5163 (06.01)
- Permanent white**
See Barium sulfate
- Permanganate time**
permanganate time of acetone/methanol, test, D 1363 (06.03)
tricresyl phosphate, test, D 1721 (06.03)
- Permeability—films**
moisture vapor transmission of organic coating films, test, D 1653 (06.01)
- Permeability absorption**
reporting particle size characteristics of pigments, practice, D 1366 (06.02)
- Permeance**
moisture vapor transmission of organic coating films, test, D 1653 (06.01)
- Peroxides**
See Active oxygen content
peroxides in styrene monomer, test, D 2340 (06.03)
trace peroxides (≥ 5 -80 ppm), using spectrophotometer, test, E 299 (06.03)
- Persian gulf oxide**
See Iron oxide red
- Persoz pendulum test**
hardness of organic coatings, by König/Persoz pendulum hardness tests, D 4366 (06.01)
- Petroleum—mineral spirits**
See Mineral spirits
- Petroleum/petroleum products**
cresylic acid content (of alkaline cresylate solutions), chemical analysis, D 3439 (06.03)

Index of ASTM Standards, Section 6

Petroleum/petroleum products—distillates

Petroleum/petroleum products—distillates

water in petroleum products/bituminous materials, by distillation, test, D 95 (06.01, 06.03)

Pfund indentation hardness

Sa Hardness tests—organic coatings

indentation hardness of organic coatings, by Knoop and Pfund methods, test, D 1474 (06.01)

Pfund wet film thickness gage

wet film thickness of organic coatings, D 1212 (06.01)

pH

Sa Acidity, alkalinity, pH (headings)

apparent pH of electrocoat baths, test, D 4584 (06.01)

apparent pH of water insoluble phenol-formaldehyde resin, test, D 4613 (06.02)

pH of chemically cleaned/etched concrete surfaces, D 4262 (06.01)

Phenol

analysis of major organic impurities in phenol produced by the cumene process, by gas chromatography, test, D 4961 (06.03)

and cresylic acid, sampling and handling, practice, D 3852 (06.03)

apparent free phenols, in synthetic phenolic resins/solutions (used in paints/related coatings), test, D 1312 (06.02)

aromatic hydrocarbons/related chemicals, terminology, D 4790 (06.03)

color of cresylic acids ("C" series standards), test, D 3627 (06.03)

phenol content of (refined) isopropylbenzene (cumene), test, D 3160 (06.03)

phenol content (of tar acid mixtures), by gas liquid chromatography, test, D 3626 (06.03)

refined phenol, spec., D 2439 (06.03)

water content, by iodine reagent method, test, D 1631 (06.03)

Phenolic resins

Sa Resins (headings)

apparent free phenols, in synthetic phenolic resins/solutions (used in paints/related coatings), test, D 1312 (06.02)

apparent pH of water insoluble phenol-formaldehyde resin, test, D 4613 (06.02)

methylol group determination (qualitative) in phenolic resins, test, D 4706 (06.02)

stroke cure time of thermosetting phenol-formaldehyde resins, test, D 4640 (06.02)

volatile content in phenolic resins, test, D 4639 (06.02)

Phosphorus acid content

zinc hydroxy phosphite, test, D 4450 (06.02)

Photographic processing

photographic documentation of coatings/lining defects and failures, D 4121 (06.01)

Photographic standards for surface preparation

standard pictorial surface preparation standards for painting steel surfaces, Δ D 2200 (06.01)

Photometry

directional reflectance factor (45-deg 0-deg) of opaque specimens, by broad-band filter reflectometry, test, E 97 (06.01)

gloss differences between surfaces of similar appearance, method for visual evaluation, D 4449 (06.01)

Phthalate ester color

pentaerythritol (for manufacture of alkyd/other synthetic resins), tests, D 2195 (06.03)

Phthalic anhydride

color in molten state/after heating, by platinum cobalt scale (includes maleic anhydride), test, D 3366 (06.03)

sampling and handling aniline, practice, D 3438 (06.03)

Phthalic anhydride—refined

refined phthalic anhydride-1308, spec., D 2403 (06.03)

Phthalic anhydride content

alkyd resins/resin solutions in absence of dibasic acids, test, D 563 (06.02)

alkyl resins/resin solutions containing dibasic acids, by gravimetric test, D 1306 (06.02)

Phthalocyanine blue

chemical analysis of phthalocyanine blue/green pigments, test, D 3256 (06.02)

Phthalocyanine green

chemical analysis of phthalocyanine blue/green pigments, test, D 3256 (06.02)

Phthalocyanine (phthalo) blue

chemical analysis of (iron/copper phthalocyanine/ultramarine) blue pigments, test, D 1135 (06.02)

copper phthalocyanine blue pigment, spec., D 963 (06.02)

Phthalocyanine (phthalo) green

phthalocyanine green pigment, spec., D 3021 (06.02)

Physical constants

calculating formulation physical constants of paints/coatings, practice, D 5201 (06.01)

Physical strength/resistance (nonchemical)

printing inks/ink films/related materials, selecting test methods, guide, D 5010 (06.01)

Pictorial surface preparation standards

Sa Surface preparation (headings)

standard pictorial surface preparation standards for painting steel surfaces, Δ D 2200 (06.01)

Pigment analysis

See Pigments (general properties)

Pigment bleeding test

bleeding characteristics, of dry pigments, test, D 279 (06.02)

Pigment content

antimony oxide content of white pigment (separated from solvent-type paints), test, D 2350 (06.02)

moisture content of pigments, D 1208 (06.02)

nonvolatile and pigment content of electrocoat baths, using muffle furnace, test, D 5145 (06.01)

paint/traffic marking material, by low-temperature furnace ashing, test, D 4451 (06.01)

pigment content of solvent-reducible paints, test, D 2371 (06.01)

solvent-reducible paints, by high-speed centrifuging, method, D 2698 (06.01)

sulfide in white pigment separated from solvent-reducible paints, test, D 2351 (06.02)

sulfur dioxide in white pigment separated from solvent-reducible paints, test, D 2352 (06.02)

titanium dioxide content of pigments (recovered from whole paint), by atomic absorption spectroscopy, test, D 4563 (06.01)

vacuum distillation (for vehicle separation in solvent-type paints), practice, D 3272 (06.01)

vehicle separation from solvent-reducible paints, by centrifuge, practice, D 2372 (06.01)

water-based paints, by low temperature ashing, test, D 3723 (06.01)

water-soluble salts in pigments, by measuring specific resistance of pigment leachate, test, D 2448 (06.02)

Pigment dispersion (paint)

Sa Pigments (general properties)

antimony oxide content of white pigment (separated from solvent-type paints), test, D 2350 (06.02)

coarse particles in pigments/pastes/paints, test, D 185 (06.01, 06.02)

evaluating degree of settling (pigment suspension/ease of remixing a shelf-aged sample) of paint, test, D 869 (06.01)

fineness of dispersion of pigment-vehicle systems, test, D 1210 (06.01)

fineness of grind, printing ink, test, D 1316 (06.01)

infrared identification of vehicle solids from solvent-reducible paints, by infrared spectroscopy, test, D 2621 (06.01)

- particle size distribution, by hydrometer of common white extender pigments, test, D 3360 (06.02)
- weight percent of solids in aqueous slurries of titanium dioxide pigments, test, D 3926 (06.02)
- white linseed oil paints—chemical analysis, selecting test methods, practice, D 215 (06.01)
- Pigment dispersion (paint)**
relative tinting strength of printing ink dispersions, test, D 2066 (06.01)
- Pigment dusts**
lead/chromium content (in air particulate filter samples of lead chromate type pigment dusts), by atomic absorption spectroscopy, test, D 4358 (06.02)
- Pigmented coatings**
volume nonvolatile matter in clear/pigmented coatings, test, D 2697 (06.01)
- Pigments—aluminum, powder and paste**
aluminum powder/paste pigments for paints, spec., D 962 (06.02)
- Pigments—aluminum silicate**
aluminum silicate (hydrous/anhydrous) pigment, analysis, test, D 718 (06.02)
anhydrous, spec., D 3619 (06.02)
hydrous, spec., D 603 (06.02)
- Pigments—barium sulfate**
barium sulfate pigments, spec., D 602 (06.02)
solar energy transmittance test of glass-fiber-reinforced plastic panels, annex D 715 (06.02)
- Pigments—basic carbonate white lead**
basic carbonate white lead pigment, spec., D 81 (06.02)
white lead—chemical analysis, test, D 1301 (06.02)
- Pigments—basic lead silicochromate**
basic lead silicochromate pigment, spec., D 1648 (06.02)
chromium trioxide content of basic lead silico-chromate pigment, test, D 1844 (06.02)
- Pigments—basic sulfate white lead**
white lead—chemical analysis, test, D 1301 (06.02)
- Pigments—black**
iron oxide black (natural)—chemical analysis, test, D 3872 (06.02)
solvent extractable material in black pigments, test, D 305 (06.02)
- Pigments—bone black**
bone black pigment, spec., D 210 (06.02)
solvent extractable material in black pigments, test, D 305 (06.02)
- Pigments—calcium borosilicate**
analysis, D 4487 (06.02)
calcium borosilicate pigments, spec., D 4288 (06.02)
- Pigments—calcium carbonate**
calcium carbonate pigment, spec., D 1199 (06.02)
- Pigments—carbon black**
carbon black pigment for paint, spec., D 561 (06.02)
solvent extractable material in black pigments, test, D 305 (06.02)
- Pigments—chrome green**
chrome green pigment, spec., D 212 (06.02)
yellow/orange/green pigments containing lead chromate/chromium oxide green, analysis, test, D 126 (06.02)
- Pigments—chrome yellow and orange**
chrome yellow/orange pigment, spec., D 211 (06.02)
yellow/orange/green pigments containing lead chromate/chromium oxide green, analysis, test, D 126 (06.02)
- Pigments—chromium oxide green**
chrome oxide green pigment, spec., D 263 (06.02)
yellow/orange/green pigments containing lead chromate/chromium oxide green, analysis, test, D 126 (06.02)
- Pigments—copper powder**
chemical analysis of cuprous oxide/copper pigments, test, D 283 (06.02)
- Pigments—cuprous oxide**
chemical analysis of cuprous oxide/copper pigments, test, D 283 (06.02)
cuprous oxide (for antifouling paints), spec., D 912 (06.02)
- Pigments—ferrous**
ochre pigment, spec., D 85 (06.02)
- Pigments—gold bronze powder**
chemical analysis of cuprous oxide/copper pigments, test, D 283 (06.02)
gold bronze powder, spec., D 267 (06.02)
- Pigments—iron blue**
chemical analysis of (iron/copper phthalocyanine/ultramarine) blue pigments, test, D 1135 (06.02)
iron blue pigment, spec., D 261 (06.02)
- Pigments—iron oxide black (natural/synthetic)**
iron oxide black (natural)—chemical analysis, test, D 3872 (06.02)
iron oxide black (synthetic)
black synthetic iron oxide pigment, spec., D 769 (06.02)
- Pigments—iron oxide brown (natural)**
analysis, D 50 (06.02)
iron oxide black (natural)—chemical analysis, test, D 3872 (06.02)
natural red/brown iron oxide pigments, spec., D 3722 (06.02)
- Pigments—iron oxide brown (synthetic)**
analysis, D 50 (06.02)
synthetic brown iron oxide pigment, spec., D 3724 (06.02)
- Pigments—iron oxide red (natural)**
analysis, D 50 (06.02)
natural red/brown iron oxide pigments, spec., D 3722 (06.02)
- Pigments—iron oxide red (synthetic)**
analysis, D 50 (06.02)
synthetic red iron oxide pigment, spec., D 3721 (06.02)
- Pigments—iron oxide yellow**
analysis, D 50 (06.02)
yellow iron oxide (hydrated), spec., D 768 (06.02)
- Pigments—lampblack**
lampblack pigment, spec., D 209 (06.02)
solvent extractable material in black pigments, test, D 305 (06.02)
- Pigments—lead chromate**
chemical/gravimetric analysis of white/yellow thermoplastic traffic marking material containing lead chromate and titanium dioxide, test, D 4797 (06.01)
- Pigments—lead zinc oxide**
analysis of white zinc pigments, test, D 3280 (06.02)
- Pigments—magnesium silicate**
magnesium silicate pigment, analysis, test, D 717 (06.02)
magnesium silicate pigment (talc), spec., D 605 (06.02)
- Pigments—mercuric oxide**
analysis, D 284 (06.02)
mercuric oxide for use in antifouling paints, spec., D 911 (06.02)
- Pigments—mica**
grit content of mica pigment, test, D 716 (06.02)
wet ground mica pigments, spec., D 607 (06.02)
- Pigments—molybdate orange**
molybdate orange pigments, spec., D 2218 (06.02)
yellow/orange/green pigments containing lead chromate/chromium oxide green, analysis, test, D 126 (06.02)
- Pigments—ocher**
analysis, D 50 (06.02)
ochre pigment, spec., D 85 (06.02)
- Pigments—para red**
para red/toluidine red pigments, testing, D 970 (06.02)
pure para red toner pigment, spec., D 475 (06.02)
- Pigments—phthalocyanine blue**
chemical analysis of (iron/copper phthalocyanine/ultramarine) blue pigments, test, D 1135 (06.02)

Index of ASTM Standards, Section 6

Pigments—phthalocyanine blue

copper phthalocyanine blue pigment, spec., D 963 (06.02)

Pigments—phthalocyanine green

chemical analysis of phthalocyanine blue/green pigments, test, D 3256 (06.02)

phthalocyanine green pigment, spec., D 3021 (06.02)

Pigments—pumice

pumice pigment, spec., D 867 (06.02)

Pigments—red lead

lead peroxide/true red lead content of dry red lead pigments, test, D 49 (06.02)

red lead pigment, spec., D 83 (06.02)

Pigments—sienna, burnt and raw

analysis, D 50 (06.02)

raw/burnt sienna pigments, spec., D 765 (06.02)

Pigments—silica

diatomaceous silica pigment, analysis, test, D 719 (06.02)

Pigments—silica, diatomaceous

diatomaceous silica pigment, spec., D 604 (06.02)

Pigments—strontium chromate

chemical analysis of strontium chromate pigment, test, D 1845 (06.02)

strontium chromate pigment, spec., D 1649 (06.02)

Pigments—titanium dioxide

chemical/gravimetric analysis of white/yellow thermoplastic traffic marking material containing lead chromate and titanium dioxide, test, D 4797 (06.01)

ratio of anatase to rutile in titanium dioxide (TiO_2) pigments, by x-ray diffraction, test, D 3720 (06.02)

titanium dioxide content of pigments (recovered from whole paint), by atomic absorption spectroscopy, test, D 4563 (06.01)

titanium dioxide pigments, spec., D 476 (06.02)

white titanium pigments, chemical analysis, test, D 1394 (06.02)

Pigments—toluidine red

para red/toluidine red pigments, testing, D 970 (06.02)

pure toluidine red toner, spec., D 656 (06.02)

Pigments—ultramarine blue

chemical analysis of (iron/copper phthalocyanine/ultramarine) blue pigments, test, D 1135 (06.02)

ultramarine blue pigment, spec., D 262 (06.02)

Pigments—umber, burnt and raw

analysis, D 50 (06.02)

raw/burnt umber pigments, spec., D 763 (06.02)

Pigments—venetian red

chemical analysis of yellow/orange/red/brown pigments containing iron/manganese, test, D 50 (06.02)

Pigments—white

analysis of white zinc pigments, test, D 3280 (06.02)

antimony oxide content of white pigment (separated from solvent-type paints), test, D 2350 (06.02)

chemical analysis of white pigments, selection of test methods, guide, D 34 (06.02)

particle size distribution, by hydrometer of common white extender pigments, test, D 3360 (06.02)

ratio of anatase to rutile in titanium dioxide (TiO_2) pigments, by x-ray diffraction, test, D 3720 (06.02)

relative tinting strength of white pigments, by reflectance measurements, test, D 2745 (06.02)

relative tinting strength of white pigments, by visual observation, test, D 332 (06.02)

sulfide in white pigment separated from solvent-reducible paints, test, D 2351 (06.02)

sulfur dioxide in white pigment separated from solvent-reducible paints, test, D 2352 (06.02)

white lead—chemical analysis, test, D 1301 (06.02)

white linseed oil paints—chemical analysis, selecting test methods, practice, D 215 (06.01)

white titanium pigments, chemical analysis, test, D 1394 (06.02)

zinc oxide pigments, spec., D 79 (06.02)

Pigments—zinc chromate

analysis, D 444 (06.02)

zinc yellow (zinc chromate) pigments, spec., D 478 (06.02)

Pigments—zinc dust

analysis, D 521 (06.02)

zinc dust pigment, spec., D 520 (06.02)

Pigments—zinc hydroxy phosphite

analysis, D 4450 (06.02)

zinc hydroxy phosphite pigment, spec., D 4462 (06.02)

Pigments—zinc oxide

analysis of white zinc pigments, test, D 3280 (06.02)

zinc oxide pigments, spec., D 79 (06.02)

Pigments—zinc sulfide

analysis of white zinc pigments, test, D 3280 (06.02)

Pigments (general properties)

See Pigment content

artists' acrylic emulsion paints, spec., D 5098 (06.01)

artists' paints (oil/resin-oil/alkyd), spec., D 4302 (06.01)

bleeding characteristics, of dry pigments, test, D 279 (06.02)

chemical analysis of yellow/orange/red/brown pigments containing iron/manganese, test, D 50 (06.02)

coarse particles in pigments/pastes/paints, test, D 185 (06.01, 06.02)

common properties of pigments, test, D 1208 (06.02)

evaluation of (clear/pigmented) coatings for rigid/semirigid plastic substrates, practice, D 3002 (06.01)

field identification of coatings, test, D 5043 (06.01)

fineness of dispersion of pigment-vehicle systems, test, D 1210 (06.01)

hygroscopic moisture (and other matter volatile under test conditions) in pigments, test, D 280 (06.02)

lightfastness of pigments (in artists' paints), test, D 4303 (06.01)

oil absorption, by Gardner-Coleman method, test, D 1483 (06.02)

oil absorption, by spatula rub-out, test, D 281 (06.02)

particle size—fineness of grind—printing inks, test, D 1316 (06.01)

relative tinting strength of chromatic paints, test, D 4838 (06.01)

relative tinting strength of white pigments, by reflectance measurements, test, D 2745 (06.02)

reporting particle size characteristics of pigments, practice, D 1366 (06.02)

specific gravity, test, D 153 (06.02)

tinting strength/color of colored pigments, by mechanical muller, test, D 387 (06.02)

tinting strength/color of colored pigments, by miniature sandmill, test, D 3022 (06.02)

volatile/nonvolatile content (of pigments), selecting test procedures, guide, D 4139 (06.02)

water-soluble salts in pigments, by measuring specific resistance of pigment leachate, test, D 2448 (06.02)

white linseed oil paints—chemical analysis, selecting test methods, practice, D 215 (06.01)

yellow/orange/green pigments containing lead chromate/chromium oxide green, analysis, test, D 126 (06.02)

Pigments (general properties)—dispersions

See Pigment dispersion (paint)

evaluating degree of settling (pigment suspension/ease of remixing a shelf-aged sample) of paint, test, D 869 (06.01)

infrared identification of vehicle solids from solvent-reducible paints, by infrared spectroscopy, test, D 2621 (06.01)

particle size distribution, by hydrometer of common white extender pigments, test, D 3360 (06.02)

Pinene

sampling and testing turpentine, method, D 233 (06.03)

Pinene—alpha and beta

wood, gum, and sulfate turpentine, by gas chromatography, test, D 3009 (06.03)

Pine tars/pine tar oils

sampling and testing pine oil, method, D 802 (06.03)

- sampling and testing pine tars/pine-tar oils, method, D 856 (06.03)
 water in liquid naval stores, test, D 890 (06.03)
- Pinhole test**
 continuity verification of liquid/sheet linings applied to concrete substrates, practice, D 4787 (06.01)
 reporting paint film failures characteristic of exterior latex paints, classification, D 1848 (06.01)
- Pipeline coatings**
 cathodic disbonding of pipeline coatings, accelerated procedure, test, G 8 (06.01)
 chemical resistance of pipeline coatings, test, G 20 (06.01)
 comparative corrosion preventive characteristics of materials used for joints/couplings/fittings/patches in pipeline coatings, test, G 18 (06.01)
 disbonding (cathodic), for pipe coatings subject to elevated/cyclic temperatures, G 42 (06.01)
 disbonding characteristics of pipeline coatings, by direct soil burial, test, G 19 (06.01)
 effects of outdoor weathering on pipeline coatings, test, G 11 (06.01)
 film thickness of pipeline coatings on steel, nondestructive measurement, method, G 12 (06.01)
 impact resistance of pipeline coatings, by falling weight test, G 14 (06.01)
 impact resistance of pipeline coatings, by limestone drop test, G 13 (06.01)
 penetration resistance of pipeline coatings, by blunt rod test, G 17 (06.01)
 resistance of steel pipeline coatings to abrasion, by slurry of coarse abrasive/water, test, G 6 (06.01)
 specific bendability of pipeline coatings, test, G 10 (06.01)
 water penetration into pipeline coatings, test, G 9 (06.01)
- Plasticizer grade alcohol**
 C₄-C₁₃ alcohol, chemical/physical analysis (selection/use of test procedures), E 852 (06.03)
- Plasticizers**
 plasticizer migration from vinyl fabrics to lacquers, method, D 2199 (06.01)
- Plastics (general)**
 directional reflectance factor (45-deg 0-deg) of opaque specimens, by broad-band filter reflectometry, test, E 97 (06.01)
 evaluation of (clear/pigmented) coatings for rigid/semirigid plastic substrates, practice, D 3002 (06.01)
 methylol group determination (qualitative) in phenolic resins, test, D 4706 (06.02)
 nitrogen (total) content of nitrogen-containing plastics/resins/resin solutions, test, D 1013 (06.02)
 operating light-/water-exposure apparatus (fluorescent-UV condensation type) for exposure of nonmetallic materials, practice, G 53 (06.01)
 volatile content in phenolic resins, test, D 4639 (06.02)
- Plastic sheet and film**
 paint spatter resistance to roller application, test, D 4707 (06.01)
- Plastic sheet method**
 capillary moisture in concrete, by plastic sheet method, test, D 4263 (06.01)
- Plastics (thermoplastic)**
 bond strength of thermoplastic traffic marking materials, using cement bricks/steel cubes, test, D 4796 (06.01)
 evaluation of color for thermoplastic traffic marking materials, test, D 4960 (06.01)
 operating light-exposure apparatus (xenon-arc type) with/without water for exposure of nonmetallic materials, practice, G 26 (06.01)
- Plastics (thermosetting)**
 operating light-exposure apparatus (xenon-arc type) with/without water for exposure of nonmetallic materials, practice, G 26 (06.01)
- Platinum-cobalt scale**
See Color (headings)
 color of clear liquids, test, D 1209 (06.01, 06.03)
 color of maleic/phthalic anhydride, in the molten state and after heating, test, D 3366 (06.03)
 color of solid aromatic hydrocarbons, in the molten state, test, D 1686 (06.03)
 solution color of 4,4'-isopropylidenediphenol (dissolved in methanol), test, D 4789 (06.03)
- Point impact**
 impact resistance of pipeline coatings, by falling weight test, G 14 (06.01)
- Polarographic methods**
 nitrobenzene in aniline, test, D 4589 (06.03)
- Polishes**
 amount of liquid separated as upper layer from a viscous solution/dispersion containing dispersed solids, test, D 4948 (06.01)
- Polycyclic hydrocarbons**
See Hydrocarbons (headings)
- Polyester resins**
 identification of carboxylic acids in alkyd resins D 2455 (06.02)
 identification of polyhydric alcohols in alkyd resins, qualitative/quantitative analysis, test, D 2456 (06.02)
 isophthalic acid content of alkyd/polyester resins, test, D 2690 (06.02)
- Polyhexafluoropylene (FEP) substrate**
 preparation of free films of organic coatings, practice, D 4708 (06.01)
- Polyhydric alcohol**
 identification of polyhydric alcohols in alkyd resins, qualitative/quantitative analysis, test, D 2456 (06.02)
 polyhydric alcohols in alkyd resins, qualitative analysis, test, D 2998 (06.02)
- Polymer content**
 polymer content of styrene monomer, test, D 2121 (06.03)
 qualitative identification of polymers in emulsion paints, by infrared analysis/pyrolysis-gas liquid chromatography, practice, D 3168 (06.01)
- Polymeric powders/powder coatings**
 selection/use of test procedures, practice, D 3451 (06.01)
- Polymerization**
 cellulose nitrate, test, D 1716 (06.02)
 sampling and testing turpentine, method, D 233 (06.03)
 unreacted monomer content of latexes, by gas-liquid chromatography, test, D 4747 (06.02)
- Polymerization inhibitors**
p-tert-butylcatechol (TBC) in styrene monomer, test, D 2120 (06.03)
- Polymerized fatty acids**
See Fatty acids—tests
- Polymer latexes**
See Latex paints
 filter-retained solids content of polymer latexes, test, D 5097 (06.02)
- Polymers**
 polymer content of styrene monomer, test, D 2121 (06.03)
 polymerization time of shellac (used for electrical insulation), test, D 411 (06.02)
 qualitative identification of polymers in emulsion paints, by infrared analysis/pyrolysis-gas liquid chromatography, practice, D 3168 (06.01)
 silicone polymers- silicon content, by atomic absorption spectrophotometry, test, D 3733 (06.02)
 solubility range, test, D 3132 (06.02)
- Polyol acetates**
 identification of polyhydric alcohols in alkyd resins, qualitative/quantitative analysis, test, D 2456 (06.02)
- Polyurethane raw materials**
See Urethanes—polyurethane raw materials (headings)

Index of ASTM Standards, Section 6

Poly(vinyl acetate) coating systems

Poly(vinyl acetate) coating systems
water content of water-reducible paints, by direct injection into gas chromatograph, test, D 3792 (06.01)

Poly(vinyl butyral) resins

See Resins (headings)

poly(vinyl butyral) chemical analysis, test, D 1396 (06.02)

Poly(vinyl chloride)(PVC) plastics—resins

poly(vinyl chloride) resins, selecting test procedures, guide, D 4368 (06.02)

residual vinyl chloride monomer content of poly(vinyl chloride) resins/compounds/copolymers by solution injection technique, test, D 3680 (06.02)

Ponderosa pine

wood used as panels in weathering tests of coatings, spec., D 358 (06.01)

Porcelain enamel products

directional reflectance factor (45-deg 0-deg) of opaque specimens, by broad-band filter reflectometry, test, E 97 (06.01)

Porosity—coating

porosity of paint films (to indicate coating penetration), test, D 3258 (06.01)

Portable adhesion testers

pull-off strength of coatings, using portable adhesion testers, test, D 4541 (06.01)

Potash blue

See Iron blue

Potassium permanganate reduction

See Permanganate time

Potentiometric method

acid number of rosin, test, D 465 (06.03)
maleic acid content of maleic anhydride, by potentiometric titration, test, D 2930 (06.03)
saponification number of rosin, test, D 464 (06.03)

Powdered chemicals

directional reflectance factor (45-deg 0-deg) of opaque specimens, by broad-band filter reflectometry, test, E 97 (06.01)

Power generating facilities

design/fabrication of flue gas desulfurization system components (for protective lining application), spec., D 4618 (06.01)
dry film thickness of protective coating systems, by destructive means, test, D 4138 (06.01)
inspection of linings in operating flue gas desulfurization systems, practice, D 4619 (06.01)
photographic documentation of coatings/lining defects and failures, D 4121 (06.01)
protective coating/lining work for power generation facilities, terminology, D 4538 (06.01)

Power law

viscosity of printing inks/vehicles, by falling-rod viscometer, test, D 4040 (06.01)

Power tool cleaning

standard pictorial surface preparation standards for painting steel surfaces, Δ D 2200 (06.01)

Precautionary labeling

labeling art materials for chronic health hazards, practice, D 4236 (06.01)

Precision

conducting interlaboratory study to determine precision of test method, practice, E 691 (06.03)

Precision—instrumentation

directional reflectance factor (45-deg 0-deg) of opaque specimens, by broad-band filter reflectometry, test, E 97 (06.01)

Preformed tape (for traffic marking)

pigment content of paint/traffic marking material, by low-temperature furnace ashing, test, D 4451 (06.01)

Pregel vehicle

laboratory preparation of gelled vehicles, using microwave oven practice, D 5166 (06.02)

Preparing specimens (for testing)

See Specimen preparation (for testing) (headings)

Prepolymers

isocyanate group content of urethane materials/prepolymers, test, D 2572 (06.02)

Pressure mottling

pressure mottling/blocking resistance of organic coatings (on metal substrates), test, D 3003 (06.01)

Primary amyl acetate

See Amyl acetate

Primary hydroxyl content

primary hydroxyl content of cellulose acetate, test, D 871 (06.02)

primary hydroxyl content of cellulose esters, test, Δ D 817 (06.02)

Primer

formability/adhesion of zinc-rich primer/chromate complex coatings (on steel), test, D 4146 (06.01)
MEK resistance of ethyl-silicate (inorganic) zinc-rich primers, by solvent rub, test, D 4752 (06.01)
testing primers/primer surfacers over preformed metal selection/use of procedures, practice, D 3322 (06.01)
zinc yellow (zinc chromate) pigments, spec., D 478 (06.02)

Primrose chrome/yellow

See Chrome yellow and orange

Printed matter

abrasion resistance of printed matter, by the ga-cat comprehensive abrasion test, D 5181 (06.01)
method for evaluating lightfastness, D 3424 (06.01)

Printing ink resins

resin solution dilutability, test, D 5062 (06.03)

Printing inks

abrasion resistance of printed matter, by the ga-cat comprehensive abrasion test, D 5181 (06.01)
apparent tack of printing inks/vehicles, by inkometer, test, D 4361 (06.01)
commercial hexanes, spec., D 1836 (06.03)
fineness of grind of printing inks, by NPIRI method, test, D 1316 (06.01)
nonvolatile content of printing inks/resin solutions/vehicles, test, D 4713 (06.01)
printing inks/ink films/related materials, selecting test methods, guide, D 5010 (06.01)
relative tinting strength of printing ink dispersions, test, D 2066 (06.01)
viscosity of printing inks/vehicles, by falling-rod viscometer, test, D 4040 (06.01)
water pickup of lithographic printing inks/vehicles in a laboratory mixer, test, D 4942 (06.01)

Printing substrates

printing inks/ink films/related materials, selecting test methods, guide, D 5010 (06.01)

Print resistance

print resistance of architectural paints, test, D 2064 (06.01)

Print resistance of lacquers

See Lacquer

Procedures

establishing procedures to qualify/certify inspection personnel for coating work in nuclear facilities, guide, D 4537 (06.01)

Production method

transfer efficiency under production conditions for spray application of automotive paints, by weight basis, practice, D 5066 (06.01)

Propionyl content

acetyl and propionyl/butyral contents of cellulose mixed esters, test, **D 817 (06.02)**

Propyl acetate

alcohol content/purity of acetate esters, by gas chromatography, test, **D 3545 (06.03)**

n-propyl acetate (96 % grade), spec., **D 3130 (06.03)**

Propyl alcohol

n-propyl alcohol (1-propanol), spec., **D 3622 (06.03)**

Propylene glycol

propylene glycol/dipropylene glycol, spec., **D 5164 (06.03)**

propylene glycol, spec., **D 2695 (06.03)**

Propylene glycol monomethyl ether acetate (PMA)

propylene glycol monomethyl ether acetate, spec., **D 4835 (06.03)**

purity of propylene glycol monomethyl ether/dipropylene glycol monomethyl ether/propylene glycol monomethyl ether acetate, test, **D 4773 (06.03)**

Propylene glycol monomethyl ether (PM)

propylene glycol monomethyl ether, spec., **D 4837 (06.03)**

purity of propylene glycol monomethyl ether/dipropylene glycol monomethyl ether/propylene glycol monomethyl ether acetate, test, **D 4773 (06.03)**

Protective coatings

analytical procedures for determining hazardous constituents in protective coatings, selecting test methods, guide, **D 3630 (06.01)**

protective coating/lining work for power generation facilities, terminology, **D 4538 (06.01)**

pull-off strength of coatings, using portable adhesion testers, test, **D 4541 (06.01)**

use of protective coating standards in nuclear power plants, selecting ASTM standards, guide, **D 5144 (06.01)**

Protective equipment

handling/sampling phenol and cresylic acid, practice, **D 3852 (06.03)**

sampling and handling aniline, practice, **D 3436 (06.03)**

Protective linings

design/fabrication of flue gas desulfurization system components (for protective lining application), spec., **D 4618 (06.01)**

inspection of linings in operating flue gas desulfurization systems, practice, **D 4619 (06.01)**

Prussian blue

See Iron blue

Pull testing

See Adhesion (headings)

adhesion of organic coatings to plastic substrates, by direct tensile testing, **D 5179 (06.01)**

bond strength of thermoplastic traffic marking materials, using cement bricks/steel cubes, test, **D 4796 (06.01)**

pull-off strength of coatings, using portable adhesion testers, test, **D 4541 (06.01)**

Pulp

solubility in sodium hydroxide, test, **D 1696 (06.02)**

Pumice/pumice stone/pumacite

pumice pigment, spec., **D 867 (06.02)**

Purity

acetaldehyde, spec., **D 4710 (06.03)**

acrylate esters, by gas chromatography, test, **D 3362 (06.03)**

alcohol content/purity of acetate esters, by gas chromatography, test, **D 3545 (06.03)**

analysis of *p*-xylene, by gas chromatography, method, **D 3798 (06.03)**

chemical analysis of benzene, by gas chromatography, test, **D 4492 (06.03)**

ethyl methyl pentanol content/purity value of 2-ethylhexanol, by gas chromatography, test, **D 5008 (06.03)**

methyl acrylate, spec., **D 4709 (06.03)**

ortho-xylene, by gas chromatography, test, **D 3797 (06.03)**

purity analysis of isopropylbenzene (cumene), by gas chromatography, test, **D 3760 (06.03)**

purity/benzene content of cyclohexane 995, by gas chromatography, test, **D 3054 (06.03)**

purity of aldehydes and ketones, test, **D 2192 (06.03)**

purity of hydrocarbons from freezing points, test, **D 1016 (06.03)**

purity of methyl (amyl ketone/isoamyl ketone), by gas chromatography, test, **D 3893 (06.03)**

purity of methyl ethyl ketone, using gas chromatography, test, **D 2804 (06.03)**

purity of methyl isobutyl ketone, by gas chromatography, test, **D 3329 (06.03)**

purity of propylene glycol monomethyl ether/dipropylene glycol monomethyl ether/propylene glycol monomethyl ether acetate, test, **D 4773 (06.03)**

purity of styrene, by freezing point method, test, **D 3799 (06.03)**

sampling/testing lac resins (orange shellac/button lac/garnet lac/bleached lac), test, **D 29 (06.02)**

sodium glycolate content of sodium carboxymethylcellulose, test, **D 1439 (06.02)**

solidification point of 4,4'-isopropylidenediphenol (Bisphenol A), test, **D 4493 (06.03)**

styrene, by gas chromatography, test, **D 3962 (06.03)**

Pyridine

aromatic hydrocarbons/related chemicals, terminology, **D 4790 (06.03)**

hydroxyl content of cellulose acetate, by spectrophotometry, test, **D 871 (06.02)**

hydroxyl content of pyridine-soluble cellulose esters, by spectrophotometry, test, **D 817 (06.02)**

pyridine base content in cresylic acid, by direct titration, test, **D 4471 (06.03)**

sampling/handling liquid cyclic products (at ambient temperature), practice, **D 3437 (06.03)**

water content, by iodine reagent method, test, **D 1631 (06.03)**

water content of paints/paint materials, by Karl Fischer method, test, **D 4017 (06.01)**

Pyridine—refined

reducing substances in, test, **D 2031 (06.03)**

refined pyridine (1 degree), spec., **D 2323 (06.03)**

water solubility, test, **D 2030 (06.03)**

Pyrolysis

field identification of coatings, test, **D 5043 (06.01)**

Pyrophyllite

See Magnesium silicate

Q**Qualifications—nuclear facilities**

coating contractors (for nuclear-powered generation facilities), practice, **D 4286 (06.01)**

establishing procedures to qualify/certify inspection personnel for coating work in nuclear facilities, guide, **D 4537 (06.01)**

journeyman painters for application of coatings to concrete surfaces of safety-related areas in nuclear facilities, practice, **D 4227 (06.01)**

journeyman painters for application of coatings to steel surfaces of safety-related areas in nuclear facilities, practice, **D 4228 (06.01)**

sample preparation for qualification testing of coatings (used in nuclear power facilities), spec., **D 5139 (06.01)**

Qualification testing

use of protective coating standards in nuclear power plants, selecting ASTM standards, guide, **D 5144 (06.01)**

Qualitative analysis/measurement

white titanium pigments, chemical analysis, test, **D 1394 (06.02)**

Quality assurance

coatings for light-water cooled nuclear power plants, practice, **D 3843 (06.01)**

Index of ASTM Standards, Section 6

Quality assurance

- use of protective coating standards in nuclear power plants, selecting ASTM standards, guide, D 5144 (06.01)

Quality control

- color of cresylic acids ("C" series standards), test, D 3627 (06.03)

Quantitative analysis

- white linseed oil paints- chemical analysis, selecting test methods, practice, D 215 (06.01)

Quinoline

- water content, by iodine reagent method, test, D 1631 (06.03)

R

Radiation exposure

- accelerated outdoor exposure tests of coatings (applied to metal substrates), practice, D 4141 (06.01)
- effects of radiation on coatings (for light-water nuclear power plants), test, D 4082 (06.01)
- exposure of paints/related coatings to fluorescent UV-condensation light-water-exposure apparatus, practice for conducting tests, D 4587 (06.01)
- operating light-exposure apparatus (xenon-arc type) with/without water for exposure of nonmetallic materials, practice, G 26 (06.01)
- temperature of applied coatings on wood products during the curing cycle, by infrared radiation thermometers, practice, D 3259 (06.01)
- ultraviolet-cured coatings, cure time, practice, D 3732 (06.01)
- use of protective coating standards in nuclear power plants, selecting ASTM standards, guide, D 5144 (06.01)

Rapid deformation

- See Deformation (headings)

Rare earths content

- paint driers, by EDTA method, test, D 3989 (06.03)

Rate of evaporation

- See Evaporation—rate/time

Raw oils (drying oils)

- See Oils (headings)

Raw sienna

- See Pigments (headings)

- chemical analysis of yellow/orange/red/brown pigments containing iron/manganese, test, D 50 (06.02)
- raw/burnt sienna pigments, spec., D 765 (06.02)

Reactor vessels

- See Nuclear reactor vessels (headings)

Reagent resistance

- factory-applied coatings on wood products, practice, D 3023 (06.01)

Reagents

- presence of and removing microbial (fungal/algal) growth on paint/related coatings, guide, D 4610 (06.01)

Reagent water—microelectronic processing

- microelectronic device processing, spec., D 1193 (06.03)

Records management

- single-/multi-panel forms for recording results of exposure tests of paints, A D 1150 (06.01)

Red copper oxide

- See Cuprous oxide

Red iron oxide (hematite)

- See Iron oxide red

Red oxide of mercury

- See Mercuric oxide

Red pigments

- See Para (paranitraniline) red/Toluidine red/Venetian red
- chemical analysis of yellow/orange/red/brown pigments containing iron/manganese, test, D 50 (06.02)
- lead peroxide/true red lead content of dry red lead pigments, test, D 49 (06.02)
- natural red/brown iron oxide pigments, spec., D 3722 (06.02)
- para red/toluidine red pigments, testing, D 970 (06.02)

- pure para red toner pigment, spec., D 475 (06.02)

- pure toluidine red toner, spec., D 656 (06.02)

- red lead pigment, spec., D 83 (06.02)

- synthetic red iron oxide pigment, spec., D 3721 (06.02)

Reduction

- refined pyridine, by reducing substances, qualitative determination, test, D 2031 (06.03)

Redwood

- wood used as panels in weathering tests of coatings, spec., D 358 (06.01)

Reference methods

- total, primary, secondary, and tertiary amine values, of fatty amines, amidoamines, and diamines, test, D 2073 (06.03)

Reference photographs

- chalking (of white/lightly tinted exterior paint films), practice, A D 4214 (06.01)

Refined benzene

- See Benzene (headings)

Refined bleached lac

- See Bleached lac—dry

Refined cresylic acid

- See Cresylic acid

Refined naphtha derivatives

- See Naphtha and naphtha derivatives

Refined phenol

- See Phenol

- refined phenol, spec., D 2439 (06.03)

Refined phthalic anhydride

- See Phthalic anhydride

Refined pyridine

- See Pyridine—refined

Refined soybean oil

- See Soybean oil

Refined tar acids

- See Tar acids—crude and refined

Reflectance and reflectivity

- chalking (of white/lightly tinted exterior paint films), practice, A D 4214 (06.01)
- gloss differences between surfaces of similar appearance, method for visual evaluation, D 4449 (06.01)
- gloss of high-gloss metallic/nonmetallic surfaces, by goniophotometry, method, E 430 (06.01)
- hiding power of paints, by reflectometry, test, A D 2805 (06.01)
- instrumental color difference, test, D 2244 (06.01)
- porosity of paint films (to indicate coating penetration), test, D 3258 (06.01)
- reflection haze (of high gloss surfaces), test, D 4039 (06.01)
- relative tinting strength of white pigments, by reflectance measurements, test, D 2745 (06.02)

Reflectance and reflectivity—copy materials

- directional reflectance factor (45-deg 0-deg) of opaque specimens, by broad-band filter reflectometry, test, E 97 (06.01)
- preparation of reference white reflectance standards, practice, E 259 (06.01)

Reflection haze

- See Haze

Reflective markers in traffic paint

- See Glass spheres (in traffic paint)

Refractive index

- gloss differences between surfaces of similar appearance, method for visual evaluation, D 4449 (06.01)
- sampling and testing dipentene, method, D 801 (06.03)
- sampling and testing pine oil, method, D 802 (06.03)
- sampling and testing turpentine, method, D 233 (06.03)

Regular bleached lac

- See Bleached lac—dry

Relative dry hiding power (of paints/coatings)

- See Hiding power—paints/coatings

Relative humidity*See* Humidity—relative**Relative tinting strength***See* Tinting strength

relative tinting strength of printing ink dispersions, test, D 2066 (06.01)

Reporting paint film failure*See* Failure end point (headings)**Residual glycol ether**

purity of propylene glycol monomethyl ether/dipropylene glycol monomethyl ether/propylene glycol monomethyl ether acetate, test, D 4773 (06.03)

Residual odor*See* Odor**Residue**

chemical/gravimetric analysis of white/yellow thermoplastic traffic marking material containing lead chromate and titanium dioxide, test, D 4797 (06.01)

sampling/testing flaked aluminum powders/pastes, methods, D 480 (06.03)

Residue—evaporation

naphthalene, test, D 2232 (06.03)

sampling and testing turpentine, method, D 233 (06.03)

Resins

alcohol-benzene soluble matter in cellulose, test, D 1794 (06.02)

amine resins—solvent tolerance, test, D 1198 (06.02)

amino resins, selecting test procedures, practice, D 4277 (06.02)

clarity/cleanliness of (nonpigmented) paint and ink liquids, by visual examination, test, D 2090 (06.02, 06.03)

field identification of coatings, test, D 5043 (06.01)

flash/fire point of liquids, by Tag open-cup apparatus, test, D 1310 (06.03)

free formaldehyde content of amino resins, test, D 1979 (06.02)

poly(vinyl butyral)—chemical analysis, test, D 1396 (06.02)

poly(vinyl chloride) resins, selecting test procedures, guide, D 4368 (06.02)

residual vinyl chloride monomer content of poly(vinyl chloride) resins/compounds/copolymers by solution injection technique, test, D 3680 (06.02)

resin solution dilutability, test, D 5062 (06.03)

softening point, by ring-and-ball apparatus, test, E 28 (06.03)

solubility range, test, D 3132 (06.02)

volatile/nonvolatile content (of cellulose/emulsions/resin solutions/shellac/varnishes), selecting test procedures, practice, D 4209 (06.02)

volatile resin acids in tall oil/gum/wood rosin, by gas chromatography, test, D 3008 (06.03)

water content of paints/paint materials, by Karl Fischer method, test, D 4017 (06.01)

Resins—alkyd

artists' paints (oil/resin-oil/alkyd), spec., D 4302 (06.01)

fatty acids content, test, D 1398 (06.02)

glycerol/ethylene glycol/pentaerythritol in alkyd resins, test, D 1615 (06.02)

identification of carboxylic acids in alkyd resins, D 2455 (06.02)

identification of polyhydric alcohols in alkyd resins, qualitative/quantitative analysis, test, D 2456 (06.02)

isophthalic acid content of alkyd/polyester resins, test, D 2690 (06.02)

phthalic anhydride content (in absence of dibasic acids), test, D 563 (06.02)

phthalic anhydride content (in presence of dibasic acids), by gravimetric test, D 1306 (06.02)

polyhydric alcohols in alkyd resins, qualitative analysis, test, D 2998 (06.02)

rosin acids content, test, D 1469 (06.02)

silicone-modified-silicon content, by atomic absorption spectrophotometry, test, D 3733 (06.02)

specific gravity at 25/25°C, test, D 1963 (06.03)

testing, practices, D 2689 (06.02)

unsaponifiable matter content, test, D 1397 (06.02)

Resins—epoxy

bond strength of thermoplastic traffic marking materials, using cement bricks/steel cubes, test, D 4796 (06.01)

epoxy content of epoxy resins, test, D 1652 (06.02)

epoxy resins, selecting test procedures, practice, D 4142 (06.02)

hydrolyzable chlorine content of liquid epoxy resins, test, D 1726 (06.02)

nitrogen (total) content of nitrogen-containing plastics/resins/resin solutions, test, D 1013 (06.02)

total chlorine content in epoxy resins/compounds, test, D 4301 (06.02)

total chlorine content, test, D 1847 (06.02)

Resins—lac

orange shellac/other indian lacs for electrical insulation, spec., D 784 (06.02)

sampling/testing lac resins (orange shellac/button lac/garnet lac/bleached lac), test, D 29 (06.02)

Resins—nitrogen

amino resins, selecting test procedures, practice, D 4277 (06.02)

nitrogen (total) content of nitrogen-containing plastics/resins/resin solutions, test, D 1013 (06.02)

Resins—phenolic

apparent free phenols, in synthetic phenolic resins/solutions (used in paints/related coatings), test, D 1312 (06.02)

apparent pH of water insoluble phenol-formaldehyde resin, test, D 4613 (06.02)

methylol group determination (qualitative) in phenolic resins, test, D 4706 (06.02)

stroke cure time of thermosetting phenol-formaldehyde resins, test, D 4640 (06.02)

volatile content in phenolic resins, test, D 4639 (06.02)

Resins—resin solutions

laboratory preparation of gelled vehicles, using microwave oven, practice, D 5166 (06.02)

Resin solution cloud point

resin solution dilutability, test, D 5062 (06.03)

Resin solutions

color of transparent liquids, by Gardner color scale, test, D 1544 (06.01, 06.02, 06.03)

glycerol/ethylene glycol/pentaerythritol in alkyd resins, test, D 1615 (06.02)

nitrogen (total) content of nitrogen-containing plastics/resins/resin solutions, test, D 1013 (06.02)

nonvolatile content of printing inks/resin solutions/vehicles, test, D 4713 (06.01)

nonvolatile content of resin solutions (in volatile organic solvents), test, D 1259 (06.02)

phthalic anhydride content, in absence of dibasic acids, test, D 563 (06.02)

resin solution dilutability, test, D 5062 (06.03)

unsaponifiable matter content, test, D 1397 (06.02)

viscosity, test, D 1725 (06.02)

Index of ASTM Standards, Section 6

Resistance

- Resistance—penetration
- Resistance—pressure mottling
- Resistance—reagent
- Resistance—sag
- Resistance—scrub
- Resistance—slip
- Resistance—solvent
- Resistance—temperature
- Resistance—water
- Resistance—abrasion (paints/related coatings)
 - abrasion resistance of organic coatings, by falling abrasive, test, D 968 (06.01)
 - abrasion resistance of printed matter, by the ga-cat comprehensive abrasion test, D 5181 (06.01)
 - air blast abrasion tester, D 658 (06.01)
 - practical washability of organic coatings, test, D 4828 (06.01)
 - resistance of steel pipeline coatings to abrasion, by slurry of coarse abrasive/water, test, G 6 (06.01)
 - Taber abraser, test, D 4060 (06.01)
 - wet abrasion resistance of interior paints to scrubbing, by weight loss, test, D 4213 (06.01)
- Resistance—acid
 - acid/mortar resistance of factory-applied clear coatings on extruded aluminum products, test, D 3260 (06.01)
- Resistance—alcohol
 - wood furniture lacquers, test, D 2571 (06.01)
- Resistance—alkali
 - clear/pigmented organic coatings, test, D 1308 (06.01)
 - dried varnish films, test, D 1647 (06.01)
- Resistance—bacteria
 - resistance of emulsion paints (in containers) to attack by microorganisms, test, D 2574 (06.01)
 - resistance to mold growth on surface of interior paint coatings (in an environmental chamber), test, D 3273 (06.01)
- Resistance—blistering
 - evaluating degree of blistering, method, D 714 (06.01)
 - testing water resistance of coatings, using controlled condensation, practice, D 4585 (06.01)
 - testing water resistance of coatings, using water fog apparatus, practice, D 1735 (06.01)
- Resistance—blocking
 - blocking resistance of trade sales paints, test, D 4946 (06.01)
 - organic coatings on wood substrates, test, D 2793 (06.01)
 - pressure mottling/blocking resistance of organic coatings (on metal substrates), test, D 3003 (06.01)
- Resistance—boiling water (H₂O)
 - wood furniture lacquers, test, D 2571 (06.01)
- Resistance—chemical
 - chemical resistance of pipeline coatings, test, G 20 (06.01)
 - clear/pigmented organic coatings, test, D 1308 (06.01)
 - coatings for light-water cooled nuclear power plants, D 3912 (06.01)
- Resistance—chipping
 - paints and related coatings, D 3170 (06.01)
 - traffic paint, D 913 (06.01)
- Resistance—coffee stain
 - wood furniture lacquers, test, D 2571 (06.01)
- Resistance—corrosion
 - See Corrosion (headings)
- Resistance—cracking
 - See Cracking—coatings
- Resistance—deformation
 - penetration resistance of pipeline coatings, by blunt rod test, G 17 (06.01)
 - resistance of organic coatings to effects of rapid deformation (impact), test, D 2794 (06.01)
- Resistance—detergent
 - organic finishes, practice, D 2248 (06.01)
- Resistance—fuel
 - solvent/fuel resistance of traffic paint, test, D 2792 (06.01)
- Resistance—heat
 - evaluating (interior/exterior) coatings for protecting steel surfaces at high-temperature service, test, D 2485 (06.01)
 - temperature-change (high-low) resistance of clear nitrocellulose lacquer films applied to wood, test, D 1211 (06.01)
- Resistance—imprinting
 - print resistance of architectural paints, test, D 2064 (06.01)
 - print resistance of lacquers, test, D 2091 (06.01)
- Resistance—mar
 - mar resistance of organic coatings, using balanced beam scrape adhesion and mar test, D 5178 (06.01)
- Resistance—mortar
 - acid/mortar resistance of factory-applied clear coatings on extruded aluminum products, test, D 3260 (06.01)
- Resistance—oil
 - wood furniture lacquers, test, D 2571 (06.01)
- Resistance—paint spatter
 - paint spatter resistance to roller application, test, D 4707 (06.01)
- Resistance—penetration
 - porosity of paint films (to indicate coating penetration), test, D 3258 (06.01)
- Resistance—pipeline coatings
 - cathodic disbonding of pipeline coatings, accelerated procedure, test, G 8 (06.01)
 - comparative corrosion preventive characteristics of materials used for joints/couplings/fittings/patches in pipeline coatings, test, G 18 (06.01)
 - effects of outdoor weathering on pipeline coatings, test, G 11 (06.01)
 - impact resistance of pipeline coatings, by falling weight test, G 14 (06.01)
 - impact resistance of pipeline coatings, by limestone drop test, G 13 (06.01)
 - specific bendability of pipeline coatings, test, G 10 (06.01)
- Resistance—pressure mottling
 - pressure mottling/blocking resistance of organic coatings (on metal substrates), test, D 3003 (06.01)
- Resistance—reagent
 - factory-applied coatings on wood products, practice, D 3023 (06.01)
- Resistance—sag
 - sag resistance of paints, using a multinotch applicator, test, D 4400 (06.01)
- Resistance—scrub
 - scrub-to-failure of interior latex flat wall paints, test, D 2486 (06.01)
 - wet abrasion resistance of interior paints to scrubbing, by weight loss, test, D 4213 (06.01)
- Resistance—slip
 - static friction of coating surfaces, test, D 4518 (06.01)
- Resistance—soil
 - practical washability of organic coatings, test, D 4828 (06.01)
- Resistance—solvent
 - solvent/fuel resistance of traffic paint, test, D 2792 (06.01)
- Resistance—stain
 - factory-applied coatings on wood products, practice, D 3023 (06.01)
 - practical washability of organic coatings, test, D 4828 (06.01)
- Resistance—temperature
 - temperature-change (high-low) resistance of clear nitrocellulose lacquer films applied to wood, test, D 1211 (06.01)
- Resistance—water
 - coatings using controlled condensation, practice, D 4585 (06.01)
 - coatings, using water immersion, practice, D 870 (06.01)
 - dried varnish films, test, D 1647 (06.01)
 - testing water resistance of coatings at 100 % relative humidity, practice, D 2247 (06.01)
 - testing water resistance of coatings, using water fog apparatus, practice, D 1735 (06.01)

- Resistance—wear**
See **Wear testing (headings)**
- Resistance—wet abrasion**
 practical washability of organic coatings, test, D 4828 (06.01)
- Retort pine tars**
See **Pine tars (kiln and retort)**
- Retroreflection/retroreflectors**
 sieve analysis of glass spheres (for retroreflective pavements markings/industrial uses), test, D 1214 (06.02)
- Rheology**
 printing inks/ink films/related materials, selecting test methods, guide, D 5010 (06.01)
- Rheology/rheological properties**
 rheological properties of non-Newtonian materials, by rotational (Brookfield) viscometer, test, D 2196 (06.01)
 static friction of coating surfaces, test, D 4518 (06.01)
- Rich gold bronze powder**
See **Copper powder**
See **Gold bronze powder**
- Ring-and-ball apparatus**
 softening point test of resins, E 28 (06.03)
- Rivets**
 paint films, evaluating degree of surface disfigurement, Δ D 3274 (06.01)
- Road service testing**
Sa **Traffic paint**
 conducting road service tests on fluid traffic marking materials, practice, D 713 (06.01)
 evaluating degree of bleeding of traffic/pavement marking paint, test, Δ D 868 (06.01)
 evaluating degree of chipping of traffic paint, method, Δ D 913 (06.01)
- Rocker hardness test (Sward)**
See **Hardness tests—Sward (rocker)**
- Roller**
 preparation of paint roller covers for evaluation, D 5069 (06.01)
- Roller application**
 paint spatter resistance to roller application, test, D 4707 (06.01)
- Roller application of paints**
 hiding power of architectural paints applied by roller, test, D 5150 (06.01)
- Roller coat**
 testing industrial water-reducible coatings, guide, D 4712 (06.01)
- Rosenmund-Kuhnhehn method**
 iodine value of drying oils and their derivatives, test, D 1541 (06.03)
- Rosin**
 acid number, test, D 465 (06.03)
 ash content, after burning and ignition, test, D 1063 (06.03)
 iron content, test, D 1064 (06.03)
 oleic acid content of tall oil rosin, test, D 1585 (06.03)
 sampling/grading rosin (delivered in commercial bags/barrels/drums), test, D 509 (06.03)
 saponification number, test, D 464 (06.03)
 unsaponifiable matter content, test, D 1065 (06.03)
 volatile oil in rosin, test, D 889 (06.03)
 volatile resin acids in tall oil/gum/wood rosin, by gas chromatography, test, D 3008 (06.03)
- Rosin acids content**
 coating vehicles (rosin esters, varnishes, and alkyd resins), test, D 1469 (06.02)
 fatty acids, test, D 1240 (06.03)
 rosin oils, testing, D 1131 (06.03)
 sampling/testing lac resins (orange shellac/button lac/garnet lac/bleached lac), test, D 29 (06.02)
 tall oil, methods of testing, D 803 (06.03)
- Rosin content**
 qualitative detection of rosin in varnishes, by Lieberman-Storch/Halphen-Hicks tests, D 1542 (06.01, 06.02)
- Rosin esters**
 rosin acids content, test, D 1469 (06.02)
- Rotational viscometer**
 rheological properties of non-Newtonian materials, by rotational (Brookfield) viscometer, test, D 2196 (06.01)
- Rouge**
See **Iron oxide red**
- Roundness of glass spheres**
 embedded in traffic paint, test for, D 1155 (06.02)
- Rubber—general**
 mandrel bend test of attached organic coatings, test, D 522 (06.01)
- Rub-out test**
 absorption of linseed oil in pigments, test, D 281 (06.02)
- Rupture/rupture strength**
 impact resistance of pipeline coatings, by falling weight test, G 14 (06.01)
 impact resistance of pipeline coatings, by limestone drop test, G 13 (06.01)
- Rust**
 degree of rusting on painted steel surfaces, method, Δ D 610 (06.01)
- Rust breakthrough**
 assessing the condition of aged coatings on steel surfaces, guide, D 5065 (06.01)
- Rutile**
 ratio of anatase to rutile in titanium dioxide (TiO₂) pigments, by x-ray diffraction, test, D 3720 (06.02)

S

- Safety precautions—coating applications**
 design/use of safety alert system for hazardous work locations in coating/lining industry, practice, Δ D 4257 (06.01)
 establishing procedures to monitor performance of safety related coatings in operating nuclear power plant, guide, D 5163 (06.01)
 handling naphthalene, maleic/phthalic anhydride, practice, D 3438 (06.03)
 handling phenol and cresylic acid, practice, D 3852 (06.03)
 handling polymeric powders, practices, D 3451 (06.01)
 sampling and handling aniline, practice, D 3436 (06.03)
 sampling/handling liquid cyclic products (at ambient temperature), practice, D 3437 (06.03)
- Safflower oil**
 safflower oil, spec., D 1392 (06.03)
- Sag resistance**
 paints, using a multinotch applicator, test, D 4400 (06.01)
- Salt**
 water-soluble salts in pigments, by measuring specific resistance of pigment leachate, test, D 2448 (06.02)
- Salt spray (fog) testing**
 salt spray (fog) testing, method, B 117 (06.01)
- Sample preparation**
 sample preparation for qualification testing of coatings (used in nuclear power facilities), spec., D 5139 (06.01)
- Sampling**
 industrial chemicals, practice, E 300 (06.03)
- Sampling—aerospace fluids**
 lead/chromium content (in air particulate filter samples of lead chromate type pigment dusts), by atomic absorption spectroscopy, test, D 4358 (06.02)
- Sampling—hydrocarbons**
 cresylic acid and phenol, practice, D 3852 (06.03)
 naphthalene, maleic anhydride, and phthalic anhydride, practice, D 3438 (06.03)
 sampling and handling aniline, practice, D 3436 (06.03)
 sampling/handling 4,4'-isopropylidene diphenol (bisphenol-A), practice, D 4297 (06.03)

Index of ASTM Standards, Section 6

Sampling—hydrocarbons

sampling/handling liquid cyclic products (at ambient temperature), practice, D 3437 (06.03)

Sampling—paints/related coatings

industrial chemicals, practice, E 300 (06.03)

paints/pigmented coatings (from containers), practice, D 3925 (06.01)

sample preparation for qualification testing of coatings (used in nuclear power facilities), spec., D 5139 (06.01)

sampling and testing shellac varnish, D 1650 (06.02)

sampling and testing turpentine, method, D 233 (06.03)

sampling/grading rosin (delivered in commercial bags/barrels/drum), test, D 509 (06.03)

sampling liquid oils/fatty acids (commonly used in paints/varnishes/related materials), test, D 1466 (06.03)

sampling/testing high-gravity glycerin, test, D 1258 (06.03)

sampling/testing lac resins (orange shellac/button lac/garnet lac/bleached lac), test, D 29 (06.02)

sampling/testing pine tars/pine-tar oils, test, D 856 (06.03)

sampling/testing volatile solvents/chemical intermediates (for paints/lacquer/varnish/related material), selecting test methods, D 268 (06.03)

Sampling—petroleum products

purity of hydrocarbons from freezing points, test, D 1016 (06.03)

Sand

abrasion resistance of organic coatings, by falling abrasive, test, D 968 (06.01)

Sandstone

preparatory surface cleaning of architectural sandstone, practice, D 5107 (06.01)

Saponification number/value

Sa Unsaponifiable matter content

apparent acetyl content of cellulose acetate propionate/butyrate, test, D 817 (06.02)

rosin, test, D 464 (06.03)

sampling and testing shellac varnish, D 1650 (06.02)

sampling/testing lac resins (orange shellac/button lac/garnet lac/bleached lac), test, D 29 (06.02)

saponification value of drying oils/fatty acids/polymerized fatty acids, test, D 1962 (06.03)

tall oil, methods of testing, D 803 (06.03)

Saybolt viscometers

See Viscometers—Saybolt

Scaling

See Flaking

Scattering coefficient

hiding power of paints, by reflectometry, test, D 2805 (06.01)

relative tinting strength of white pigments, by reflectance measurements, test, D 2745 (06.02)

Scrub resistance

scrub-to-failure of interior latex flat wall paints, test, D 2486 (06.01)

Sealers (floor)

See Floor paints/coatings

Secondary butyl acetate (85–88 % grade)

See *n*-Butyl acetate (all grades)

Secondary butyl alcohol

See *sec*-Butyl alcohol

Sediment

clarity/cleaness of (nonpigmented) paint and ink liquids, by visual examination, test, D 2090 (06.02, 06.03)

Sedimentation

reporting particle size characteristics of pigments, practice, D 1366 (06.02)

Self-aligning adhesion tester

pull-off strength of coatings, using portable adhesion testers, test, D 4541 (06.01)

Semi-gloss paints

interior latex semigloss/gloss paints, selecting test methods, guide, D 4540 (06.01)

Sensory evaluation—odor

volatile solvents and diluents, test, D 1296 (06.03)

Service Level I

establishing procedures to monitor performance of safety related coatings in operating nuclear power plant, guide, D 5163 (06.01)

Service level I and II

use of protective coating standards in nuclear power plants, selecting ASTM standards, guide, D 5144 (06.01)

Setaflash testers

flash point of liquids, by Setaflash closed-cup apparatus, test, D 3278 (06.03)

sustained burning (of liquid mixtures), by Seta-flash tester (open cup), test, D 4206 (06.01, 06.03)

Settlement

evaluating degree of settling (pigment suspension/ease of remixing a shelf-aged sample) of paint, test, D 869 (06.01)

traffic paint, in containers, by laboratory simulation, test, D 1309 (06.01)

Set-to-touch-time

See Drying time

Shear testing—paints/related coatings/materials

consistency of paints, using Stormer viscometer, test, D 562 (06.01)

subjecting marine antifouling coating to bifouling and fluid shear forces in natural seawater, test, D 4939 (06.01)

viscosity of printing inks/vehicles, by falling-rod viscometer, test, D 4040 (06.01)

Shear thinning

rheological properties of non-Newtonian materials, by rotational (Brookfield) viscometer, test, D 2196 (06.01)

Sheen

Sa Gloss

gloss/sheen uniformity evaluation, test, D 3928 (06.01)

practical washability of organic coatings, test, D 4828 (06.01)

specular gloss of nonmetallic specimens, test, D 523 (06.01)

Sheet materials (general)

continuity verification of liquid/sheet linings applied to concrete substrates, practice, D 4787 (06.01)

Sheet metal

flexibility/adhesion of organic coatings (paints) on prepainted deformed metallic sheets, test, D 4145 (06.01)

mandrel bend test of attached organic coatings, test, D 522 (06.01)

Shellac

sampling and testing shellac varnish, D 1650 (06.02)

shellac varnishes, spec., D 360 (06.02)

volatile/nonvolatile content (of cellulose/ emulsions/resin solutions/shellac/varnishes), selecting test procedures, practice, D 4209 (06.02)

Shellac—electrical insulating

orange shellac/other indian lacs for electrical insulation, spec., D 784 (06.02)

shellac (dry/powdered) used for electrical insulation, selecting test methods, D 411 (06.02)

Shellac—orange

orange shellac and (button lac/garnet lac), spec., D 237 (06.02)

sampling and testing shellac varnish, D 1650 (06.02)

sampling/testing lac resins (orange shellac/button lac/garnet lac/bleached lac), test, D 29 (06.02)

Shipping

amount of liquid separated as upper layer from a viscous solution/dispersion containing dispersed solids, test, D 4948 (06.01)

impact resistance of pipeline coatings, by falling weight test, G 14 (06.01)

Shortness ratio

laboratory preparation of gelled vehicles, using microwave oven, practice, D 5166 (06.02)

Short-radius bends

specific bendability of pipeline coatings, test, **G 10 (06.01)**

SI (International System of Units)

use of international system of units (SI) (modernized metric system), excerpts,
(Related Material—all volumes) **(06.01, 06.02, 06.03)**

Sienna (burnt and raw)

chemical analysis of yellow/orange/red/brown pigments containing iron/manganese, test, **D 50 (06.02)**
raw/burnt sienna pigments, spec., **D 765 (06.02)**

Sieve analysis

sieve analysis of glass spheres (for retroreflective pavements markings/industrial uses), test, **D 1214 (06.02)**

Sieve analysis—subsieve

reporting particle size characteristics of pigments, practice, **D 1366 (06.02)**

Silanes/Siloxane

nonvolatile content in silanes/siloxanes/silane-siloxane blends used in masonry water-repellent treatments, test, **D 5095 (06.01)**

Silica content

acid-soluble extenders in (iron/copper phthalocyanine/ultramarine) blue pigments, test, **D 1135 (06.02)**
cellulose, test, **D 2438 (06.02)**
chromium trioxide content of basic lead silico-chromate pigment, test, **D 1844 (06.02)**
free silica in barium sulfate pigment, test, **D 715 (06.02)**
white titanium pigments, chemical analysis, test, **D 1394 (06.02)**

Silica (diatomaceous)

diatomaceous silica pigment, spec., **D 604 (06.02)**

Silicon content

silicon polymers and silicon-modified alkyls, by atomic absorption spectrophotometry test, **D 3733 (06.02)**

Silicon dioxide (SiO₂) content

silicon dioxide in magnesium silicate pigment, test, **D 717 (06.02)**

Silicone-coated paper

preparation of free films of organic coatings, practice, **D 4708 (06.01)**

Silicone-modified alkyls

silicon content, by atomic absorption spectrophotometry, test, **D 3733 (06.02)**

Silicone polymers

silicon content, by atomic absorption spectrophotometry, test, **D 3733 (06.02)**

Simulated accident conditions

purity of methyl isobutyl ketone, by gas chromatography, test, **D 3911 (06.01)**

Single-panel forms

recording results on single-/multi-panel forms, method, **D 1150 (06.01)**

Skinning

See **Stability—package**

Skins content

clarity/cleanliness of (nonpigmented) paint and ink liquids, by visual examination, test, **D 2090 (06.02, 06.03)**

Slag

conductimetric analysis of water-soluble ionic contamination of blasting abrasives, test, **D 4940 (06.01)**

Sliding scale calibration graph

viscosity of printing inks/vehicles, by falling-rod viscometer, test, **D 4040 (06.01)**

Slip resistance

static friction of coating surfaces, test, **D 4518 (06.01)**

Slope

laboratory preparation of gelled vehicles, using microwave oven, practice, **D 5166 (06.02)**

Slump

slump of face glazing/bedding compounds on metal sash, test, **D 2376 (06.01)**

Solid phase materials—paints/related coatings/materials**Slurries**

conductimetric analysis of water-soluble ionic contamination of blasting abrasives, test, **D 4940 (06.01)**
resistance of steel pipeline coatings to abrasion, by slurry of coarse abrasive/water, test, **G 6 (06.01)**
weight percent of solids in aqueous slurries of titanium dioxide pigments, test, **D 4926 (06.02)**

Smudging

abrasion resistance of printed matter, by the ga-cat comprehensive abrasion test, **D 5181 (06.01)**

Soapstone

See **Magnesium silicate**

Sodium carboxymethylcellulose

sodium glycolate content of sodium carboxymethylcellulose, test, **D 1439 (06.02)**

Sodium glycolate content

sodium glycolate content of sodium carboxymethylcellulose, test, **D 1439 (06.02)**

Sodium hydroxide (caustic soda)

residual *p-tert*-butylcatechol (TBC) in styrene monomer, by addition of NaOH, test, **D 4590 (06.03)**
solubility in sodium hydroxide, test, **D 1696 (06.02)**

Sodium sulfite

free formaldehyde content of amino resins, test, **D 1979 (06.02)**

Softening point

clear/pigmented organic coatings, test, **D 1308 (06.01)**
resins, by ring-and-ball apparatus, test, **E 28 (06.03)**

Soil accumulation

paint films, evaluating degree of surface disfigurement, **D 3274 (06.01)**

Soil burial test

disbonding characteristics of pipeline coatings, by direct soil burial, test, **G 19 (06.01)**

Soil removal properties

practical washability of organic coatings, test, **D 4828 (06.01)**

Solar spectral irradiance

operating light-exposure apparatus (xenon-arc type) with/without water for exposure of nonmetallic materials, practice, **G 26 (06.01)**

Solidification point

4,4'-isopropylidenediphenol (Bisphenol A), test, **D 4493 (06.03)**
aromatic hydrocarbons/related chemicals, terminology, **D 4790 (06.03)**
benzene, test, **D 852 (06.03)**
solidification point of industrial organic chemicals, test, **D 1493 (06.03)**
solidification (titer) point of fatty acids, test, **D 1982 (06.03)**

Solid phase materials—paints/related coatings/materials

amount of liquid separated as upper layer from a viscous solution/dispersion containing dispersed solids, test, **D 4948 (06.01)**

calculating formulation physical constants of paints/coatings, practice, **D 5201 (06.01)**

determining liquid/solid status (of viscous materials), test, **D 4359 (06.01)**

filter-retained solids content of polymer latexes, test, **D 5097 (06.02)**

flash point (of fuel oils/lube oils/suspension of solids/liquids), by Pensky-Martens closed tester, test, **D 93 (06.03)**

infrared identification of vehicle solids from solvent-reducible paints, by infrared spectroscopy, test, **D 2621 (06.01)**

toluene-insoluble solid matter (sand/chips/dirt/bark) in rosin, test, **D 269 (06.03)**

volatile/nonvolatile content (of cellulose/emulsions/resin solutions/shellac/varnishes), selecting test procedures, practice, **D 4209 (06.02)**

volatile/nonvolatile content (of driers/drying oils/naval stores and solvents), selecting test procedures, guide, **D 4140 (06.03)**

Index of ASTM Standards, Section 6

Solid phase materials—paints/related coatings/materials

- volatile/nonvolatile content (of pigments), selecting test procedures, guide, **D 4139 (06.02)**
- weight percent of solids in aqueous slurries of titanium dioxide pigments, test, **D 3926 (06.02)**
- Solubility**
 - refined pyridine in water, test, **D 2030 (06.03)**
 - resin solution dilutability, test, **D 5062 (06.03)**
 - solubility in sodium hydroxide, test, **D 1696 (06.02)**
 - solubility range (of resins/polymers), test, **D 3132 (06.02)**
 - soluble cellulose nitrate, testing, methods, **D 301 (06.02)**
- Solubility—alkali**
 - solubility in sodium hydroxide, test, **D 1696 (06.02)**
- Soluble cellulose nitrate nitrocellulose**
 - soluble cellulose nitrate, testing, methods, **D 301 (06.02)**
- Soluble sulfates content**
 - lead peroxide/true red lead content of dry red lead pigments, test, **D 49 (06.02)**
- Solution injection technique**
 - residual vinyl chloride monomer content of poly(vinyl chloride) resins/compounds/copolymers by solution injection technique, test, **D 3680 (06.02)**
- Solvent analysis (of solvent-type paints)**
 - direct injection with a gas chromatograph, practice, **D 3271 (06.01)**
- Solvent and fuel resistance of traffic paints**
 - See Traffic paint
- Solvent brushing and wiping**
 - See Steel panels
- preparation of hot-dipped nonpassivated galvanized steel panels for testing paint/varnish/lacquer/related products, test, **D 2201 (06.01)**
- Solvent-extractable matter**
 - pigment content of solvent-reducible paints, test, **D 2371 (06.01)**
- Solvent naphtha (refined)**
 - See Naphtha and naphtha derivatives
- Solvent-reducible paints/coatings**
 - amount of liquid separated as upper layer from a viscous solution/dispersion containing dispersed solids, test, **D 4948 (06.01)**
 - antimony content (low concentrations) in solids of liquid coatings/dried films, by atomic absorption spectroscopy, test, **D 3717 (06.01)**
 - antimony oxide content of white pigment (separated from solvent-type paints), test, **D 2350 (06.02)**
 - artists' paints (oil/resin-oil/alkyd), spec., **D 4302 (06.01)**
 - blocking resistance of trade sales paints, test, **D 4946 (06.01)**
 - calculating formulation physical constants of paints/coatings, practice, **D 5201 (06.01)**
 - chromium content (low concentrations) in solids of liquid coatings/dried films, by atomic absorption spectroscopy, test, **D 3718 (06.01)**
 - commercial hexanes, spec., **D 1836 (06.02)**
 - conducting tests on paint/varnish/lacquer/related products, using enclosed carbon-arc light/water exposure apparatus, practice, **D 5031 (06.01)**
 - directional reflectance factor (45-deg 0-deg) of opaque specimens, by broad-band filter reflectometry, test, **E 97 (06.01)**
 - erosion testing of antifouling paints, using high velocity water, test, **D 4938 (06.01)**
 - exterior house/trim paint, selection/use of test methods, practice, **D 2932 (06.01)**
 - field identification of coatings, test, **D 5043 (06.01)**
 - floor paint, selection/use of test methods, practice, **D 3383 (06.01)**
 - hiding power of architectural paints applied by roller, test, **D 5150 (06.01)**
 - hiding power of paints, by reflectometry, test, **D 2805 (06.01)**
 - identification of oils and oil acids in solvent-reducible paints, test **D 2245 (06.03)**
 - infrared identification of vehicle solids from solvent-reducible paints, by infrared spectroscopy, test, **D 2621 (06.01)**
 - interior flat wall paint, selection/use of test methods, practice, **D 3323 (06.01)**
 - interior semigloss wall/trim enamels, selection/use of test methods, practice, **D 3425 (06.01)**
 - lead/cadmium/cobalt content (low concentrations) in nonvolatile portion of liquid coatings/dried films, by atomic absorption spectroscopy, test, **D 3335 (06.01)**
 - lead content in paint, by direct aspiration atomic absorption spectroscopy, test, **D 4834 (06.01)**
 - mandrel bend test of attached organic coatings, test, **D 522 (06.01)**
 - mercury content (low concentrations) in liquid coatings/coatings vehicles/dried films, by atomic absorption spectroscopy, test, **D 3624 (06.01)**
 - nature of thinners in solvent-reducible paints, qualitative determination, method, **D 2349 (06.01)**
 - package stability of solvent-reducible/water-reducible paint, test, **D 1849 (06.01)**
 - paint spatter resistance to roller application, test, **D 4707 (06.01)**
 - pigment content, high-speed centrifuging, test, **D 2698 (06.01)**
 - pigment content of solvent-reducible paints, test, **D 2371 (06.01)**
 - porosity of paint films (to indicate coating penetration), test, **D 3258 (06.01)**
 - practical washability of organic coatings, test, **D 4828 (06.01)**
 - preparing drawdowns of artists' paste paints, practice, **D 4941 (06.01)**
 - relative tinting strength of chromatic paints, test, **D 4838 (06.01)**
 - solvent analysis, by gas chromatography direct injection method, practice, **D 3271 (06.01)**
 - subjecting marine antifouling coating to biofouling and fluid shear forces in natural seawater, test, **D 4939 (06.01)**
 - sulfide in white pigment separated from solvent-reducible paints, test, **D 2351 (06.02)**
 - sulfur dioxide in white pigment separated from solvent-reducible paints, test, **D 2352 (06.02)**
 - testing solvent-borne architectural (interior/exterior) coatings, guide, **D 5146 (06.01)**
 - testing water resistance of coatings at 100 % relative humidity, practice, **D 2247 (06.01)**
 - titanium dioxide content in paint, by x-ray fluorescence spectroscopy, test, **D 4764 (06.01)**
 - vacuum distillation (for vehicle separation in solvent-type paints), practice, **D 3272 (06.01)**
 - vehicle separation from solvent-reducible paints, by centrifuge, practice, **D 2372 (06.01)**
 - volatile matter content determination, test, **D 2369 (06.01)**
 - volatile organic compounds (VOC) of solvent reducible paints in aerosol cans, test, **D 5200 (06.01)**
 - volume nonvolatile matter in clear/pigmented coatings, test, **D 2697 (06.01)**
 - water content of paints/paint materials, by Karl Fischer method, test, **D 4017 (06.01)**
 - wet-to-dry hiding change of architectural coatings, test, **D 5007 (06.01)**
 - wood used as panels in weathering tests of coatings, spec., **D 358 (06.01)**
 - Solvent release**
 - amount of volatile organic compound (VOC) released from solventborne automotive coatings and available for removal in a VOC control device (abatement), test, **D 5087 (06.01)**
 - Solvent rub method**
 - MEK resistance of ethyl silicate (inorganic) zinc-rich primers, by solvent rub, test, **D 4752 (06.01)**
 - Solvents**
 - field identification of coatings, test, **D 5043 (06.01)**
 - hexyl acetate, spec., **D 5137 (06.03)**

Index of ASTM Standards, Section 6

- mineral (petroleum) spirits hydrocarbon drycleaning solvent, spec., D 235 (06.03)
- trace peroxides (≥ 5 -80 ppm); using spectrophotometer, test, E 299 (06.03)
- Solvents—hydrocarbon**
 - aniline point/mixed aniline point of petroleum products/hydrocarbon solvents, test, D 611 (06.03)
 - benzene content in hydrocarbon solvents, by gas chromatography, test, D 4367 (06.03)

 - making and preparing concrete/masonry panels for testing paint finishes, method, D 1734 (06.01)
 - paint and related coatings exposure tests, methods for preparation, D 609 (06.01)
 - pH of chemically cleaned/etched concrete surfaces, D 4262 (06.01)
 - preparation of aluminum/aluminum-alloy surfaces (for painting), practice, D 1730 (06.01)
 - preparation of hot-dip aluminum surfaces (for painting), practice, D 1731 (06.01)
 - preparation of hot-dipped nonpassivated galvanized steel panels for testing paint/varnish/lacquer/related products, test, D 2201 (06.01)
 - preparation of methyl esters from fatty acids, for fatty acid composition analysis, test, D 3457 (06.03)
 - preparation of paint brushes for evaluation, practice, D 5068 (06.01)
 - preparation of paint roller covers for evaluation, D 5069 (06.01)
 - preparing drawdowns of artists' paste paints, practice, D 4941 (06.01)
 - preparing glass panels for testing, D 3891 (06.01)
 - reference white reflectance standards, practice, E 259 (06.01)
 - selection of coating specimens and preparation for appearance measurement, practice, D 3964 (06.01)

Index of ASTM Standards, Section 6

Specimen preparation (for testing)—paints/related coatings

standard pictorial surface preparation standards for painting steel surfaces, **D 2200 (06.01)**
 surface cleaning concrete (for coating), practice, **D 4258 (06.01)**
 surface cleaning concrete unit masonry (for coating), practice, **D 4261 (06.01)**

zinc-coated (galvanized) steel, practice, **D 2092 (06.01)**

Specimen preparation (general)—paints/related coatings
 sample preparation for qualification testing of coatings (used in nuclear power facilities), spec., **D 5139 (06.01)**

Spectral data

conducting tests on paint/varnish/lacquer/related products, using enclosed carbon-arc light/water exposure apparatus, practice, **D 5031 (06.01)**
 directional reflectance factor (45-deg 0-deg) of opaque specimens, by broad-band filter reflectometry, test, **E 97 (06.01)**
 gloss of high-gloss metallic/nonmetallic surfaces, by goniophotometry, method, **E 430 (06.01)**
 operating light-exposure apparatus (xenon-arc type) with/without water for exposure of nonmetallic materials, practice, **G 26 (06.01)**

Spectrometry—mass

color of cresylic acids ("C" series standards), test, **D 3627 (06.03)**

Spectrophotometry—absorption

carbon disulfide content of aromatic hydrocarbons, using spectrophotometry, test, **D 2324 (06.03)**
 iron content (of rosin), **D 1064 (06.03)**
 spectrophotometric diene value of dehydrated castor oil/derivatives, test, **D 1358 (06.03)**
 thiophene content of benzene, by spectrophotometry, test, **D 1685 (06.03)**

Spectrophotometry—atomic absorption (of paints/related coatings)

lead content in paint, by direct aspiration atomic absorption spectroscopy, test, **D 4834 (06.01)**
 metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, **D 4085 (06.02)**
 organotin release rates of antifouling coating systems in sea water, using graphite furnace atomic absorption spectrophotometry (GF-AAS), test, **D 5108 (06.01)**
 relative tinting strength of printing ink dispersions, test, **D 2066 (06.01)**

Spectrophotometry—goniophotometry

gloss of high-gloss metallic/nonmetallic surfaces, by goniophotometry, method, **E 430 (06.01)**

Spectrophotometry—infrared

cellulose nitrate in alkyd lacquers, quantitative determination by infrared spectrophotometry, test, **D 3133 (06.01)**
 infrared identification of vehicle solids from solvent-reducible paints, by infrared spectroscopy, test, **D 2621 (06.01)**
 qualitative identification of polymers in emulsion paints, by infrared analysis/pyrolysis-gas liquid chromatography, practice, **D 3168 (06.01)**
 uniformity (of traffic paint vehicle solids), practice, **D 2743 (06.01)**

Spectroscopy—absorption (of paint)

lead/chromium content (in air particulate filter samples of lead chromate type pigment dusts), test, **D 4358 (06.02)**
 lead content in paint, by direct aspiration atomic absorption spectroscopy, test, **D 4834 (06.01)**
 titanium dioxide content of pigments (recovered from whole paint), by atomic absorption spectroscopy, test, **D 4563 (06.01)**

Spectroscopy—atomic absorption

antimony content (low concentrations) in solids of liquid coatings/dried films, by atomic absorption spectroscopy, test, **D 3717 (06.01)**
 chromium content (low concentrations) in solids of liquid coatings/dried films, by atomic absorption spectroscopy, test, **D 3718 (06.01)**

lead/cadmium/cobalt content (low concentrations) in nonvolatile portion of liquid coatings/dried films, by atomic absorption spectroscopy, test, **D 3335 (06.01)**
 mercury content (low concentrations) in liquid coatings/coatings vehicles/dried films, by atomic absorption spectroscopy, test, **D 3624 (06.01)**

Spectroscopy—x-ray fluorescence (XRF)

sulfur content (of cellulosic materials), test **D 2929 (06.02)**
 titanium dioxide content in paint, by x-ray fluorescence spectroscopy, test, **D 4764 (06.01)**

Specular gloss

See Gloss

Spirits of turpentine

See Turpentine

Spoilage

See Stability—package

Spray-applied coatings

See Coatings (headings)

evaluating and comparing transfer conditions-laboratory conditions, test, **D 5009 (06.01)**
 transfer efficiency under production conditions for spray application of automotive paints, by weight basis, practice, **D 5066 (06.01)**

Spray method

testing industrial water-reducible coatings, guide, **D 4712 (06.01)**

Spreading rate

hiding power of paints, by reflectometry, test, **D 2805 (06.01)**

Stability—paints/related coatings/materials

accelerated testing of paints/varnishes/lacquers/related products, using filtered open flame carbon-arc light/water exposure apparatus, practice, **D 822 (06.01)**
 conducting tests on paint/varnish/lacquer/related products, using enclosed carbon-arc light/water exposure apparatus, practice, **D 5031 (06.01)**
 copper phthalocyanine blue pigment, spec., **D 963 (06.02)**
 estimating package stability of coatings for ultraviolet curing, test, **D 4144 (06.01)**
 freeze-thaw resistance of water-borne coatings, test, **D 2243 (06.01)**
 heat stability of cellulose acetate, test, **D 871 (06.02)**
 heat stability of cellulose ester, test, **D 817 (06.02)**
 light stability of clear coatings, by sunlight-through-glass method, test, **D 2620 (06.01)**
 package stability of solvent-reducible/water-reducible paint, test, **D 1849 (06.01)**

Staining

effect of staining agents (on organic finishes in the automobile industry), practice, **D 1540 (06.01)**
 practical washability of organic coatings, test, **D 4828 (06.01)**
 stain removal (from multicolor lacquers on primed steel panels), test, **D 2198 (06.01)**
 stain resistance of factory-applied coatings on wood products, practice, **D 3023 (06.01)**

Standard color solutions

See Color (headings)

Static coefficient of friction

See Coefficient of friction

Statistical methods

conducting interlaboratory study to determine precision of test method, practice, **E 691 (06.03)**

Steam-distilled wood turpentine

See Turpentine

Steel

bond strength of thermoplastic traffic marking materials, using cement bricks/steel cubes, test, **D 4796 (06.01)**

Steel—panels

paint and related coatings exposure tests, methods for preparation, **D 609 (06.01)**

Index of ASTM Standards, Section 6

preparation of hot-dipped nonpassivated galvanized steel panels for testing paint/varnish/lacquer/related products, test, **D 2201 (06.01)**

Steel—substrates
film thickness of pipeline coatings on steel, nondestructive measurement, method, **G 12 (06.01)**

Steel—surfaces
assessing the condition of aged coatings on steel surfaces, guide, **D 5065 (06.01)**
coating contractor qualification (for nuclear-powered generation facilities), practice, **D 4286 (06.01)**
degree of rusting on painted steel surfaces, method, **D 610 (06.01)**
evaluating (interior/exterior) coatings for protecting steel surfaces at high-temperature service, test, **D 2485 (06.01)**
profile of abrasive blast-cleaned steel surfaces, in laboratory/field/fabricating shop, test, **D 4417 (06.01)**
qualification of journeyman painters for application of coatings to steel surfaces of safety-related areas in nuclear facilities, practice, **D 4228 (06.01)**

Steel blue pigment
See Iron blue

Steel cubes
bond strength of thermoplastic traffic marking materials, using cement bricks/steel cubes, test, **D 4796 (06.01)**

Steel panels
paint and related coatings exposure tests, methods for preparation, **D 609 (06.01)**
preparation of hot-dipped nonpassivated galvanized steel panels for testing paint/varnish/lacquer/related products, test, **D 2201 (06.01)**

Steel samples
sample preparation for qualification testing of coatings (used in nuclear power facilities), spec., **D 5139 (06.01)**

Step gages
wet film thickness of organic coatings, by notched gages, practice, **D 4414 (06.01)**

Sticking
blocking resistance of trade sales paints, test, **D 4946 (06.01)**

Stiffness
free films of paints and related coatings, test, **D 2370 (06.01)**

Stone—marble/limestone/sandstone/granite
preparatory surface cleaning of architectural sandstone, practice, **D 5107 (06.01)**

Stormer method
consistency of paints, using Stormer viscometer, test, **D 562 (06.01)**
sampling and testing pine tars/pine-tar oils, method, **D 856 (06.03)**

Strength—general
colored pigments, by miniature sandmill method, test, **D 3022 (06.02)**

Strength—tinting
colored pigments (dry/pastes in oil), using a mechanical muller, test, **D 387 (06.02)**
relative tinting strength of white pigments, by reflectance measurements, test, **D 2745 (06.02)**
relative tinting strength of white pigments, by visual observation, test, **D 332 (06.02)**

Stress
pull-off strength of coatings, using portable adhesion testers, test, **D 4541 (06.01)**
subjecting marine antifouling coating to biofouling and fluid shear forces in natural seawater, test, **D 4939 (06.01)**

Strip test
detection of copper corrosion from petroleum products, by copper strip tarnish test, **D 130 (06.03)**

Stroke cure time
stroke cure time of thermosetting phenol-formaldehyde resins, test, **D 4640 (06.02)**

Sulfate content—paints/related coatings

Strontium chromate pigment
See Pigments (general properties)
chemical analysis of strontium chromate pigment, test, **D 1845 (06.02)**
strontium chromate pigment, spec., **D 1649 (06.02)**

Structural applications—paint
field identification of coatings, test, **D 5043 (06.01)**

Styrene
analysis of styrene by capillary gas chromatography, test, **D 5135 (06.03)**
apparent density of industrial aromatic hydrocarbons, test, **D 2935 (06.03)**
benzene content of cyclic hydrocarbon products, by gas chromatography, test, **D 4534 (06.03)**
commercial density (of pure liquid chemicals), test, **D 3505 (06.03)**
peroxides in styrene monomer, test, **D 2119 (06.03)**
peroxides in styrene monomer, test, **D 2119 (06.03)**
polymer content of styrene monomer, test, **D 2121 (06.03)**
p-*tert*-butylcatechol (TBC) in styrene monomer, test, **D 2120 (06.03)**
purities/impurities, by gas chromatography, test, **D 3962 (06.03)**
purity of hydrocarbons from freezing points, test, **D 1016 (06.03)**
purity of styrene, by freezing point method, test, **D 3799 (06.03)**
residual *p*-*tert*-butylcatechol (TBC) in styrene monomer, by addition of NaOH, test, **D 4590 (06.03)**
sampling/handling liquid cyclic products (at ambient temperature), practice, **D 3437 (06.03)**
styrene monomer 996, spec., **D 2827 (06.03)**
unreacted monomer content of latexes, by gas-liquid chromatography, test, **D 4747 (06.02)**
unreacted monomer content of latexes using capillary column gas chromatography, test, **D 4827 (06.02)**
volume/weight of industrial aromatic hydrocarbons, method, **D 1555 (06.03)**

Styrene-butadiene coatings systems
dichloromethane/1,1,1-trichloroethane content in paints/coatings, by direct injection gas chromatography, test, **D 4457 (06.01)**
water content of water-reducible paints, by direct injection into gas chromatograph, test, **D 3792 (06.01)**

Subsieve analysis
See Sieve analysis—subsieve (headings)

Substrates—coating applications
accelerated outdoor exposure tests of coatings (applied to metal substrates), practice, **D 4141 (06.01)**
adhesion of coating films to metallic substrates, by tape test, **D 3359 (06.01)**
adhesion of organic coatings to plastic substrates, by direct tensile testing, **D 5179 (06.01)**
discontinuity (holiday) testing of nonconductive protective coating on metallic substrates, practice, **D 5162 (06.01)**
mandrel bend test of attached organic coatings, test, **D 522 (06.01)**
painting inspectors (metal substrates), guide, **D 3276 (06.01)**
paint spatter resistance to roller application, test, **D 4707 (06.01)**
preparation of free films of organic coatings, practice, **D 4708 (06.01)**
specifying inspection requirements for coating/lining work on metal substrates, guide, **D 5161 (06.01)**
testing solvent-borne architectural (interior/exterior) coatings, guide, **D 5146 (06.01)**

Sulfate ash content
pentaerythritol (for manufacture of alkyd/other synthetic resins), tests, **D 2195 (06.03)**

Sulfate content—paints/related coatings
acid-insoluble extenders in (iron/copper phthalocyanine/ultramarine) blue pigments, test, **D 1135 (06.02)**
cellulose acetate propionates/butyrate, test, **D 817 (06.02)**
cellulose acetate, test, **D 871 (06.02)**

Index of ASTM Standards, Section 6

Sulfate content—paints/related coatings

- lead peroxide/true red lead content of dry red lead pigments, test, **D 49 (06.02)**
- yellow/orange/green pigments containing lead chromate/chromium oxide green, test, **D 126 (06.02)**
- Sulfated ash content**
 - ashing cellulose, test, **D 3516 (06.02)**
 - ethylcellulose, test, **D 914 (06.02)**
- Sulfate white lead pigments**
 - See Basic sulfate white lead
- Sulfate wood turpentine**
 - See Turpentine
- Sulfide content**
 - sulfide in white pigment separated from solvent-reducible paints, test, **D 2351 (06.02)**
- Sulfur content**
 - cellulose acetate propionates/butyrate, test, **D 817 (06.02)**
 - cellulose acetate, test, **D 871 (06.02)**
 - cellulosic materials, by X-ray fluorescence, test, **D 2929 (06.02)**
 - sulfur (trace quantities) in liquid aromatic hydrocarbons, by oxidative microcoulometry, test, **D 3961 (06.03)**
 - zinc dust (metallic zinc powder), test, **D 521 (06.02)**
- Sulfur content—petroleum products**
 - mineral (petroleum) spirits hydrocarbon drycleaning solvent, spec., **D 235 (06.03)**
 - sampling/handling 4,4'-isopropylidene diphenol (bisphenol-A), practice, **D 4297 (06.03)**
- Sulfur dioxide (SO₂) content**
 - qualitative, of industrial aromatic hydrocarbons, test, **D 853 (06.03)**
 - sulfur dioxide in white pigment separated from solvent-reducible paints, test, **D 2352 (06.02)**
- Sunflower oil**
 - sunflower oil (once-refined, technical grade), spec., **D 3169 (06.03)**
- Sunlight/monochromatic light exposure**
 - lightfastness of pigments (in artists' paints), test, **D 4303 (06.01)**
- Surface analysis—paints/related coatings/materials**
 - gloss differences between surfaces of similar appearance, method for visual evaluation, **D 4449 (06.01)**
 - gloss of high-gloss metallic/nonmetallic surfaces, by goniophotometry, method, **E 430 (06.01)**
 - printing inks/ink films/related materials, selecting test methods, guide, **D 5010 (06.01)**
 - profile of abrasive blast-cleaned steel surfaces, in laboratory/field/fabricating shop, test, **D 4417 (06.01)**
 - pull-off strength of coatings, using portable adhesion testers, test, **D 4541 (06.01)**
 - static friction of coating surfaces, test, **D 4518 (06.01)**
 - subjecting marine antifouling coating to biofouling and fluid shear forces in natural seawater, test, **D 4939 (06.01)**
 - temperature of applied coatings on wood products during the curing cycle, by infrared radiation thermometers, practice, **D 3259 (06.01)**
- Surface preparation—paints/related coatings**
 - See Specimen preparation (for testing)—paints/related coatings
 - preparation of hot-dipped nonpassivated galvanized steel panels for testing paint/varnish/lacquer/related products, test, **D 2201 (06.01)**
 - preparatory surface cleaning of architectural sandstone, practice, **D 5107 (06.01)**
 - standard pictorial surface preparation standards for painting steel surfaces, **D 2200 (06.01)**
- Surfacer**
 - See Primer
- Surfaces (of nuclear facilities)**
 - coating contractor qualification (for nuclear-powered generation facilities), practice, **D 4286 (06.01)**

- qualification of journeyman painters for application of coatings to concrete surfaces of safety-related areas in nuclear facilities, practice, **D 4227 (06.01)**
- qualification of journeyman painters for application of coatings to steel surfaces of safety-related areas in nuclear facilities, practice, **D 4228 (06.01)**
- Surface water resistance**
 - See Resistance—water
- Surveillance**
 - establishing procedures to monitor performance of safety related coatings in operating nuclear power plant, guide, **D 5163 (06.01)**
- Suspension fluids**
 - flash point (of fuel oils/lube oils/suspension of solids/liquids), by Pensky-Martens closed tester, test, **D 93 (06.03)**
- Sustained burning test**
 - sustained burning (of liquid mixtures), by Seta-flash tester (open cup), test, **D 4206 (06.01, 06.03)**
 - sustained burning (of low viscosity liquid mixtures), by Wick test, **D 4207 (06.03)**
- Swelling**
 - clear/pigmented organic coatings, test, **D 1308 (06.01)**
- Swelling and cracking**
 - edge performance of composite wood products under surfactant accelerated moisture stress, test, **D 2065 (06.01)**
- Synthetic amyl alcohol**
 - amyl alcohol (synthetic), spec., **D 319 (06.03)**
- Synthetic black iron oxide (magnetite)**
 - See Iron oxide black
- Synthetic drying oils**
 - See Oils—drying
- Synthetic ethylhexanol**
 - See 2-Ethylhexanol
- Synthetic hematite (red)**
 - See Iron oxide red
- Synthetic phenolic resins**
 - See Resins—phenolic
- Synthetic pine oil**
 - See Oils—pine (natural/synthetic)
- Synthetic primary amyl acetate**
 - See Primary amyl acetate
- Synthetic yellow iron oxide**
 - See Iron oxide yellow

T

- Tack**
 - apparent tack of printing inks/vehicles, by inkometer, test, **D 4361 (06.01)**
- Tag closed-cup tester**
 - flash point by Tag closed tester, test, **D 56 (06.03)**
- Tag open-cup tester**
 - flash/fire point of liquids, by Tag open-cup apparatus, test, **D 1310 (06.03)**
- Talc (pigment)**
 - See Magnesium silicate
- Tall oil/tall oil rosin**
 - tall oil, methods of testing, **D 803 (06.03)**
 - volatile resin acids in tall oil/gum/wood rosin, by gas chromatography, test, **D 3008 (06.03)**
- Tank cars/wagons/other shipping containers**
 - See Containers—tank cars/wagons
- Tanks**
 - creosylic acid and phenol, practice, **D 3852 (06.03)**
 - sampling and handling aniline, practice, **D 3436 (06.03)**
 - sampling/handling liquid cyclic products (at ambient temperature), practice, **D 3437 (06.03)**

Tar acids

- color of cresylic acids ("C" series standards), test, D 3627 (06.03)
- gel time, test, D 2870 (06.03)
- phenol content (of tar acid mixtures), by gas liquid chromatography, test, D 3626 (06.03)

TBC inhibitor

- p*-tert-butylcatechol (TBC) in styrene monomer, test, D 2120 (06.03)
- residual *p*-tert-butylcatechol (TBC) in styrene monomer, by addition of NaOH, test, D 4590 (06.03)

TDI content

- See Free toluene diisocyanate content

Temperature (application)

- bond strength of thermoplastic traffic marking materials, using cement bricks/steel cubes, test, D 4796 (06.01)
- chemical/gravimetric analysis of white/yellow thermoplastic traffic marking material containing lead chromate and titanium dioxide, test, D 4797 (06.01)

Temperature service applications—high

- conducting tests on paint/varnish/lacquer/related products, using enclosed carbon-arc light/water exposure apparatus, practice, D 5031 (06.01)

Temperature tests—paints/related coatings/materials

- evaluating (interior/exterior) coatings for protecting steel surfaces at high-temperature service, test, Δ D 2485 (06.01)
- exposure of paints/related coatings to fluorescent UV-condensation light-water-exposure apparatus, practice for conducting tests, D 4587 (06.01)
- freeze-thaw resistance of water-borne coatings, test, D 2243 (06.01)
- low-temperature coalescence (of latex paint films), test, D 3793 (06.01)
- minimum film formation temperature (MFFT) of emulsion vehicles, test, D 2354 (06.02)
- nonvolatile content of latexes, test, D 4758 (06.02)
- operating light-exposure apparatus (xenon-arc type) with/without water for exposure of nonmetallic materials, practice, G 26 (06.01)
- pigment content of paint/traffic marking material, by low-temperature furnace ashing, test, D 4451 (06.01)
- solidification point of 4,4'-isopropylidenediphenol (Bisphenol A), test, D 4493 (06.03)
- temperature-change (high-low) resistance of clear nitrocellulose lacquer films applied to wood, test, D 1211 (06.01)
- temperature of applied coatings on wood products during the curing cycle, by infrared radiation thermometers, practice, D 3259 (06.01)

Temperature tests—plastics

- operating light-exposure apparatus (xenon-arc type) with/without water for exposure of nonmetallic materials, practice, G 26 (06.01)

Ten-degree xylene (10° xylol)

- See Xylene (ten-degree)

Tension (tensile) properties/tests—paints/related coatings

- adhesion of organic coatings to plastic substrates, by direct tensile testing, D 5179 (06.01)
- paints/related coatings (free films), test, D 2370 (06.01)
- preparation of free films of organic coatings, practice, D 4708 (06.01)

Terminology—paints/related coatings/materials

- aromatic hydrocarbons/related chemicals, terminology, D 4790 (06.03)
- cellulose/cellulose derivatives, terminology, D 1695 (06.02)
- freeze-thaw resistance of water-borne coatings, test, D 2243 (06.01)
- paint/varnish/lacquer/related products, terminology, D 16 (06.01, 06.02, 06.03)

Terpene alcohols content

- sampling and testing pine oil, method, D 802 (06.03)

Terpene solvents

- See Solvents (headings)

- sampling and testing dipentene, method, D 801 (06.03)

Terra alba

- See Calcium sulfate content

Terra di sienna

- See Sienna (burnt and raw)

Testing methods

- recording results on single-/multi-panel forms, method, Δ D 1150 (06.01)

Testing methods—paints/related coatings

- See Guides for testing paints/related coatings/materials

Test samples

- sample preparation for qualification testing of coatings (used in nuclear power facilities), spec., D 5139 (06.01)

Test specimens

- See Specimen preparation (for testing) (headings)

Tetraethylammonium bromide

- titanium dioxide content in paint, by x-ray fluorescence spectroscopy, test, D 4764 (06.01)

Texture

- gloss differences between surfaces of similar appearance, method for visual evaluation, D 4449 (06.01)

Thawing

- See Freezing and thawing

Thermal black

- See Pigments—carbon black

Thermal degradation and endurance

- cellulose acetate, test, D 871 (06.02)
- soluble cellulose nitrate, testing, methods, D 301 (06.02)

Thermal transmittance

- See Transmittance and reflectance

Thermal voltaic-type infrared radiation thermometers

- temperature of applied coatings on wood products during the curing cycle, by infrared radiation thermometers, practice, D 3259 (06.01)

Thermistor-type infrared radiation thermometers

- temperature of applied coatings on wood products during the curing cycle, by infrared radiation thermometers, practice, D 3259 (06.01)

Thermometers

- thermometer specifications for flash point (of fuel oils/lube oils/suspension of solids/liquids), by Pensky-Martens closed tester, test, D 93 (06.03)

Thermoplastic traffic marking

- evaluation of color for thermoplastic traffic marking materials, test, D 4960 (06.01)

Thermoplastic traffic marking material

- chemical/gravimetric analysis of white/yellow thermoplastic traffic marking material containing lead chromate and titanium dioxide, test, D 4797 (06.01)
- pigment content of paint/traffic marking material, by low-temperature furnace ashing, test, D 4451 (06.01)

Thermosetting materials/properties—resins

- stroke cure time of thermosetting phenol-formaldehyde resins, test, D 4640 (06.02)

Thermosetting phenol-formaldehyde

- See Phenolic resins

Thickness—paints/related coatings/materials

- dry film thickness, of nonmagnetic coatings (paints/varnish/lacquer) applied to a ferrous base, D 1186 (06.01)
- dry film thickness of protective coating systems, by destructive means, test, D 4138 (06.01)
- erosion testing of antifouling paints, using high velocity water, test, D 4938 (06.01)
- producing films of uniform thickness of paint/varnish/related products on test panels, test, D 823 (06.01)
- subjecting marine antifouling coating to bifouling and fluid shear forces in natural seawater, test, D 4939 (06.01)

Index of ASTM Standards, Section 6

Thickness—paints/related coatings/materials

wet film thickness of organic coatings, by notched gages, practice, D 4414 (06.01)

Thinners (paint)

See Paint—thinners

Thiophene content

refined benzene, by gas chromatography (with flame photometric detection), test, D 4735 (06.03)

thiophene content of benzene, by spectrophotometry, test, D 1685 (06.03)

Thiosulfate method

chromium content of strontium chromate pigment, by thiosulfate method, test, D 1845 (06.02)

Thixotropy

rheological properties of non-Newtonian materials, by rotational (Brookfield) viscometer, test, D-2196 (06.01)

Three-degree xylol (3° xylol)

See Xylene (nitration grade)

Time tests

amount of liquid separated as upper layer from a viscous solution/dispersion containing dispersed solids, test, D 4948 (06.01)

Tinting strength

colored pigments (dry/pastes in oil), with a mechanical muller, test, D 387 (06.02)

relative tinting strength of chromatic paints, test, D 4838 (06.01)

relative tinting strength of printing ink dispersions, test, D 2066 (06.01)

relative tinting strength of white pigments, by reflectance measurements, test, D 2745 (06.02)

relative tinting strength of white pigments, by visual observation, test, D 332 (06.02)

Titanium content

white titanium pigments, chemical analysis, test, D 1394 (06.02)

Titanium dioxide slurries

weight percent of solids in aqueous slurries of titanium dioxide pigments, test, D 3926 (06.02)

Titanium dioxide (TiO₂)

ratio of anatase to rutile in titanium dioxide (TiO₂) pigments, by x-ray diffraction, test, D 3720 (06.02)

relative tinting strength of white pigments, by reflectance measurements, test, D 2745 (06.02)

titanium dioxide content in paint, by x-ray fluorescence spectroscopy, test, D 4764 (06.01)

titanium dioxide content of pigments (recovered from whole paint), by atomic absorption spectroscopy, test, D 4563 (06.01)

titanium dioxide pigments, spec., D 476 (06.02)

weight percent of solids in aqueous slurries of titanium dioxide pigments, test, D 3926 (06.02)

white titanium pigments, chemical analysis, test, D 1394 (06.02)

Titer

solidification (titer) point of fatty acids, test, D 1982 (06.03)

Titrimetric method

resin solution dilutability, test, D 5062 (06.03)

Toluene

acidity of benzene/toluene/xylolnes/solvent naphthas/similar industrial aromatic hydrocarbons, test, D 847 (06.03)

acid wash color, test, D 848 (06.03)

apparent density of industrial aromatic hydrocarbons, test, D 2935 (06.03)

aromatic hydrocarbons/related chemicals, terminology, D 4790 (06.03)

benzene content of cyclic hydrocarbon products, by gas chromatography, test, D 4534 (06.03)

commercial density (of pure liquid chemicals), test, D 3505 (06.03)

distillation, test, D 850 (06.03)

impurities in high-purity ethylbenzene, by gas chromatography, test, D 5060 (06.03)

nitration grade toluene, spec., D 841 (06.03)

purity of hydrocarbons from freezing points, test,

D 1016 (06.03)

sampling/handling liquid cyclic products (at ambient temperature), practice, D 3437 (06.03)

soluble cellulose nitrate, testing, methods, D 301 (06.02)

total non-aromatic/trace monocyclic hydrocarbon-aromatic hydrocarbons in high-purity benzene/toluene/mixed xylenes, by gas chromatography, test, D 2360 (06.03)

trace (total) chloride (organic/inorganic) in liquid aromatic hydrocarbons, test, D 5194 (06.03)

volume/weight of industrial aromatic hydrocarbons, method, D 1555 (06.03)

xylene isomer analysis, by gas chromatography, test, D 2306 (06.03)

Toluene insolubles content

toluene-insoluble solid matter (sand/chips/dirt/bark) in rosin, test, D 269 (06.03)

Toluidine red

pure toluidine red toner, spec., D 656 (06.02)

Toluidine red pigment

para red/toluidine red pigments; testing, D 970 (06.02)

Toner (para/toluidine red)

para red/toluidine red pigments; testing, D 970 (06.02)

Top liquid layers

amount of liquid separated as upper layer from a viscous solution/dispersion containing dispersed solids, test, D 4948 (06.01)

Total chloride content

See Chloride content (headings)

Total nitrogen oxides content

See Nitrogen oxides

Total sulfur content

See Sulfate content (headings)

Total titanium

total titanium in white titanium pigments, by Jones reductor/aluminum reduction method, test, D 1394 (06.02)

Toxicity/toxicology

unreacted monomer content of latexes, by gas-liquid chromatography, test, D 4747 (06.02)

Trace elements contents

sulfur (trace quantities) in liquid aromatic hydrocarbons, by oxidative microcoulometry, test, D 3961 (06.03)

Trace elements contents—chloride

See Chloride content (headings)

trace (total) chloride (organic/inorganic) in liquid aromatic hydrocarbons, test, D 5194 (06.03)

Trace impurities content

See Impurities content

See Purity

Trace lead/cadmium/cobalt paint

lead/cadmium/cobalt content (low concentrations) in nonvolatile portion of liquid coatings/dried films, by atomic absorption spectroscopy, test, D 3335 (06.01)

Trace monomers

unreacted monomer content of latexes, by gas-liquid chromatography, test, D 4747 (06.02)

Trade sales paint

blocking resistance of trade sales paints, test, D 4946 (06.01)

Traffic marking materials

evaluation of color for thermoplastic traffic marking materials, test, D 4960 (06.01)

Traffic paint

evaluating degree of bleeding of traffic/pavement marking paint, test, D 868 (06.01)

evaluating degree of chipping, D 913 (06.01)

glass spheres in, test for roundness, D 1155 (06.02)

laboratory evaluation of degree of bleeding of traffic/pavement marking paint; test, D 969 (06.01)

U

- laboratory test for settling properties, during storage, D 1309 (06.01)
- methods of conducting road service tests on, D 713 (06.01)
- no-pick-up time (drying time), test, D 711 (06.01)
- pigment content of paint/traffic marking material, by low-temperature furnace ashing, test, D 4451 (06.01)
- practices for testing, D 2205 (06.01)
- sieve analysis of glass spheres (for retroreflective pavements markings/industrial uses), test, D 1214 (06.02)
- solvent and fuel resistance, test, D 2792 (06.01)
- uniformity of vehicle solids (by spectroscopy/gas chromatography), selection and use of test procedures, practice, D 2743 (06.01)
- Transesterification**
identification of carboxylic acids in alkyd resins D 2455 (06.02)
- Transfer efficiency (TE)**
evaluating and comparing transfer conditions-laboratory conditions, test, D 5009 (06.01)
- transfer efficiency under production conditions for spray application of automotive paints, by weight basis, practice, D 5066 (06.01)
- Transparent liquids**
See Liquids
- Tributyl tin (TBT)**
organotin release rates of antifouling coating systems in sea water, using graphite furnace atomic absorption spectrophotometry (GF-AAS), test, D 5108 (06.01)
- Trichlorotrifluoroethane-extractable matter**
permanganate time of acetone/methanol, test, D 1721 (06.03)
- unsaponifiable matter content, test, D 1399 (06.03)
- Tricresyl phosphate**
tricresyl phosphate, spec., D 363 (06.03)
- volatile matter in tricresyl phosphate, test, D 1468 (06.03)
- Tristimulus value**
See Color (headings)
calculation of color differences from instrumentally measured color coordinates, test, D 2244 (06.01)
- directional reflectance factor (45-deg 0-deg) of opaque specimens, by broad-band filter reflectometry, test, E 97 (06.01)
- True red lead**
lead peroxide/true red lead content of dry red lead pigments, test, D 49 (06.02)
- Tung oil**
See Oils—tung
- Tunnel method**
small-scale evaluation of fire-retardant paints, by 2-foot tunnel method, test, D 3806 (06.01)
- Turbidimetric method**
reporting particle size characteristics of pigments, practice, D 1366 (06.02)
- Turbidity**
resin solution dilutability, test, D 5062 (06.03)
- Turkey red**
See Iron oxide red
- Turkish umber**
See UMBER (burnt and raw)
- Turpentine**
pinene composition, by gas chromatography, test, D 3009 (06.03)
- sampling and testing turpentine, method, D 233 (06.03)
- spirits of turpentine, spec., D 13 (06.03)
- Twenty-four hour testing**
amount of liquid separated as upper layer from a viscous solution/dispersion containing dispersed solids, test, D 4948 (06.01)
- Two-foot tunnel method**
small-scale evaluation of fire-retardant paints, by 2-foot tunnel method, test, D 3806 (06.01)
- Ultrafiltrates**
acid/base milliequivalent content of (anodic/cathodic) electrocoat baths/their ultrafiltrates, test, D 4370 (06.01)
- apparent pH of electrocoat baths, test, D 4584 (06.01)
- electrical conductivity of electrocoat baths, test, D 4399 (06.01)
- nonvolatile and pigment content of electrocoat baths, using muffle furnace, test, D 5145 (06.01)
- Ultramarine blue pigment**
chemical analysis of (iron/copper phthalocyanine/ultramarine) blue pigments, test, D 1135 (06.02)
- chemical analysis of phthalocyanine blue/green pigments, test, D 3256 (06.02)
- ultramarine blue pigment, spec., D 262 (06.02)
- Ultraviolet-cured coatings**
cure time, practice for reporting, D 3732 (06.01)
- estimating package stability of coatings for ultraviolet curing, test, D 4144 (06.01)
- Ultraviolet (UV) light/radiation**
accelerated testing of paints/varnishes/lacquers/related products, using filtered open flame carbon-arc light/water exposure apparatus, practice, D 822 (06.01)
- conducting tests on paint/varnish/lacquer/related products, using enclosed carbon-arc light/water exposure apparatus, practice, D 5031 (06.01)
- exposure of paints/related coatings to fluorescent UV-condensation light-water-exposure apparatus, practice for conducting tests, D 4587 (06.01)
- Umber (burnt and raw)**
chemical analysis of yellow/orange/red/brown pigments containing iron/manganese, test, D 50 (06.02)
- raw/burnt umber pigments, spec., D 763 (06.02)
- Underground environments**
cathodic disbonding of pipeline coatings, accelerated procedure, test, G 8 (06.01)
- Uniform thickness (of paints/related coatings)**
See Thickness—paints/related coatings/materials
- Unloading tank cars/wagons/other shipping containers**
cresylic acid and phenol, practice, D 3852 (06.03)
- naphthalene, maleic/phthalic anhydride, practice, D 3438 (06.03)
- sampling and handling aniline, practice, D 3436 (06.03)
- Unreacted monomer content**
unreacted monomer content of latexes, by gas-liquid chromatography, test, D 4747 (06.02)
- unreacted monomer content of latexes using capillary column gas chromatography, test, D 4827 (06.02)
- Unsaponifiable matter content**
alkyd resins and resin solutions, test, D 1397 (06.02)
- rosin, test, D 1065 (06.03)
- tall oil, methods of testing, D 803 (06.03)
- tricresyl phosphate, test, D 1399 (06.03)
- unsaponifiable matter in drying oils/fatty acids/polymerized fatty acids, test, D 1965 (06.03)
- Unsaturation**
drying oils/derivatives total, by modified Rosenmund-Kuhnemann method, test, D 1541 (06.03)
- drying oils/derivatives Wijs method, test, D 1959 (06.03)
- Up and down method**
impact resistance of pipeline coatings, by falling weight test, G 14 (06.01)
- Upper liquid layer**
amount of liquid separated as upper layer from a viscous solution/dispersion containing dispersed solids, test, D 4948 (06.01)
- Urethanes**
isocyanate group content of urethane materials/prepolymers, test, D 2572 (06.02)

Index of ASTM Standards, Section 6

Urethanes

unreacted toluene diisocyanates in urethane prepolymers/
coating solutions, by gas chromatography, test,
D 3432 (06.02)

Urethanes—coatings

2-ethoxyethyl acetate (99 % grade), spec., D 3728 (06.03)
isocyanate group content of urethane materials/prepolymers,
test, D 2572 (06.02)
unreacted toluene diisocyanates in urethane prepolymers/
coating solutions, by gas chromatography, test,
D 3432 (06.02)

V

Vanadium content

paint driers, by EDTA method, test, D 3988 (06.03)

Vapors

chemical resistance of pipeline coatings, test, G 20 (06.01)
preparation of free films of organic coatings, practice,
D 4708 (06.01)

Variances in manufacturing process

sampling industrial chemicals, annex, practice, E 300 (06.03)

Varnish

acidity in volatile solvents/chemical intermediates (used in
paint/varnish/lacquer/related products), test,
D 1613 (06.03)
conducting tests on paint/varnish/lacquer/related products,
using enclosed carbon-arc light/water exposure apparatus,
practice, D 5031 (06.01)

Varnishes

abrasion resistance, by air blast abrasion test, Δ D 658 (06.01)
abrasion resistance of organic coatings, by falling abrasive, test,
D 968 (06.01)
accelerated testing of paints/varnishes/lacquers/related products,
using filtered open flame carbon-arc light/water exposure
apparatus, practice, D 822 (06.01)
acid value of organic coating materials, test, D 1639 (06.01)
adhesion (to smooth panel surfaces), by scrape adhesion test,
D 2197 (06.01)
clarity/clearness of (nonpigmented) paint and ink liquids, by
visual examination, test, D 2090 (06.02, 06.03)
clear/pigmented organic coatings, test, D 1308 (06.01)
color of transparent liquids, by Gardner color scale, test,
D 1544 (06.01, 06.02, 06.03)
discoloration (light stability), test, D 2620 (06.01)
dried varnish films, test, D 1647 (06.01)
dry film thickness of nonconductive coatings (applied to
nonferrous metal base), nondestructive measurement, test,
D 1400 (06.01)
dry-film thickness of organic coatings, using micrometers, test,
D 1005 (06.01)
elasticity/toughness of varnishes, test, D 1642 (06.01)
elongation/tensile strength/stiffness, test, D 2370 (06.01)
exterior durability, test, D 1641 (06.01)
film formation rates in drying or curing process, at room
temperature, test, D 1640 (06.01)
flash point of liquids, by Setaflash closed-cup apparatus, test,
D 3278 (06.03)
gas checking and draft test, D 1643 (06.01)
glacial acrylic acid (99.0 % grade), spec., D 4416 (06.03)
high shear viscosity (of paints/varnishes/related products), by
ICI cone/plate viscometer, test, D 4287 (06.01)
indentation hardness of organic coatings, by Knoop and Pfund
methods, test, D 1474 (06.01)
liquid paint driers, selection of test methods, D 564 (06.03)
methyl *n*-amyl ketone (98 % grade), spec., D 4360 (06.03)
moisture vapor transmission of organic coating films, test,
D 1653 (06.01)
nonvolatile matter content, test, D 1644 (06.01)
paint and related coatings exposure tests, methods for
preparation, D 609 (06.01)

paint/varnish/lacquer/related products, terminology,

D 16 (06.01, 06.02, 06.03)

paint/varnish/lacquer/related products, test, Δ D-1475 (06.01)

preparation of free films of organic coatings, practice,
D 4708 (06.01)

preparing glass panels for testing, D 3891 (06.01)

qualitative detection of rosin in varnishes, by Lieberman-

Storch/Halphen-Hicks tests, D 1542 (06.01, 06.02)

rosin acids content, test, D 1469 (06.02)

sampling and testing shellac varnish, D 1650 (06.02)

selection and use of test procedures, D 154 (06.01)

specific gravity at 25/25°C, test, D 1963 (06.03)

standard environments for conditioning/testing paint/
varnish/lacquer/related materials, spec., D 3924 (06.01)

steel surfaces, resistance to failure, by water immersion test,
D 870 (06.01)

testing water resistance of coatings at 100 % relative humidity,
practice, D 2247 (06.01)

viscosity of paints/varnishes/lacquers, by Ford viscosity cup,
test, D 1200 (06.01)

viscosity (of paints/varnishes/lacquers/related materials), by
dip-type viscosity cups, test, D 4212 (06.01)

volatile content in phenolic resins, test, D 4639 (06.02)

volatile/nonvolatile content (of cellulose/emulsions/resin
solutions/shellac/varnishes), selecting test procedures,
practice, D 4209 (06.02)

wet film thickness of organic coatings, D 1212 (06.01)

wet film thickness of organic coatings, by notched gages,
practice, D 4414 (06.01)

Vegetable origin

artists' paints (oil/resin-oil/alkyd), spec., D 4302 (06.01)

Vehicles

nonvolatile content of printing inks/resin solutions/vehicles,
test, D 4713 (06.01)

Vehicle separation—solvent-type paints

amount of liquid separated as upper layer from a viscous
solution/dispersion containing dispersed solids, test,
D 4948 (06.01)

high-speed centrifuge, for pigment content, test, D 2698 (06.01)

infrared identification of vehicle solids from solvent-reducible
paints, by infrared spectroscopy, test, D 2621 (06.01)

pigment content of solvent-reducible paints, test, D 2371 (06.01)

vacuum distillation (for vehicle separation in solvent-type
paints), practice, D 3272 (06.01)

vehicle separation from solvent-reducible paints, by centrifuge,
practice, D 2372 (06.01)

Vehicle solids content

See Solids content

Venetian red

chemical analysis of yellow/orange/red/brown pigments
containing iron/manganese, test, D 50 (06.02)

Vinyl acetate

acetaldehyde content of vinyl acetate, test, D 2191 (06.03)

acidity in vinyl acetate and acetaldehyde, test, D 2086 (06.03)

hydroquinone in vinyl acetate, test, D 2193 (06.03)

vinyl acetate, spec., D 2190 (06.03)

Vinyl antifouling coatings

See Antifouling coating system

Vinyl chloride monomer (residual) content

residual vinyl chloride monomer content of poly(vinyl chloride)
resins/compounds/copolymers by solution injection
technique, test, D 3680 (06.02)

Viscometers—Brookfield

rheological properties of non-Newtonian materials, by rotational
(Brookfield) viscometer, test, D 2196 (06.01)

Viscometers—falling rod

viscosity of printing inks/vehicles, by falling-rod viscometer,
test, D 4040 (06.01)

Viscometers—Ford

viscosity of paints/varnishes/lacquers, by Ford viscosity cup, test, D 1200 (06.01)

Viscometers—Gardner-Holdt

tall oil, methods of testing, D 803 (06.03)

Viscometers—ICI cone/plate

high shear viscosity (of paints/varnishes/related products), by ICI cone/plate viscometer, test, D 4287 (06.01)

Viscometers—Saybolt

viscosity of pine tars/pine-tar oils, by Stormer/Saybolt Furof viscometers, test, D 856 (06.03)

Viscometers—Stormer

viscosity of pine tars/pine-tar oils, by Stormer/Saybolt Furof viscometers, test, D 856 (06.03)

Viscometers—Weissenberg Rheogoniometer

viscosity of polymeric powders/powder coatings, test, D 3451 (06.01)

Viscometers—Zahn

coil coatings, testing, practice, D 3794 (06.01)

Viscosity—paints/related coatings/materials

cellulose acetate propionates/butyrate, test, D 817 (06.02)

cellulose acetate, test, D 871 (06.02)

coil coatings, testing, practice, D 3794 (06.01)

comparison of the brush drag of latex paints, test, D 4958 (06.01)

consistency of paints, using Stormer viscometer, test, D 562 (06.01)

dip-type viscosity cup, test, D 4212 (06.01)

ethylcellulose, test, D 914 (06.02)

high shear viscosity (of paints/varnishes/related products), by ICI cone/plate viscometer, test, D 4287 (06.01)

hydrogen sulfide/sulfur dioxide (qualitative) of industrial aromatic hydrocarbons, test, D 2363 (06.02)

hydroxyethylcellulose, test, D 2364 (06.02)

intrinsic viscosity of cellulose, test, D 1795 (06.02)

methylcellulose, test, D 1347 (06.02)

paints/varnishes/lacquers, by Ford viscosity cup, test, D 1200 (06.01)

polymeric powders/powder coatings, by Weissenberg rheogoniometer, test, D 3451 (06.01)

resin solutions, test, D 1725 (06.02)

rheological properties of non-Newtonian materials, by rotational (Brookfield) viscometer, test, D 2196 (06.01)

rosin oil, test, D 1131 (06.03)

sodium glycolate content of sodium carboxymethylcellulose, test, D 1439 (06.02)

soluble cellulose nitrate, testing, methods, D 301 (06.02)

soluble nitrocellulose base solutions, test, D 365 (06.02)

tall oil, methods of testing, D 803 (06.03)

transparent liquids, by bubble-tome method, test, D 1545 (06.01, 06.02, 06.03)

viscosity of cellulose derivatives, by ball-drop method, test, D 1343 (06.02)

viscosity of paints/related materials, by ISO flow cups, test, D 5125 (06.03)

viscosity of pine tars/pine-tar oils, by Stormer/Saybolt Furof viscometers, test, D 856 (06.03)

viscosity of printing inks/vehicles, by falling-rod viscometer, test, D 4040 (06.01)

Wick test (for low viscosity liquids) D 4207 (06.03)

Viscosity at high shear

high shear viscosity (of paints/varnishes/related products), by ICI cone/plate viscometer, test, D 4287 (06.01)

Viscous Liquids/materials

flash point (of fuel oils/lube oils/suspension of solids/liquids), by Pensky-Martens closed tester, test, D 93 (06.03)

liquid/solid status (of viscous materials), test, D 4359 (06.01)

Visual examination—paints/related coatings/materials

clarity/cleanliness (of nonpigmented) paint and ink liquids, by visual examination, test, D 2090 (06.02, 06.03)

Volatile matter content

color of cresylic acids ("C" series standards), test, D 3627 (06.03)

color (of maleic anhydride/phthalic anhydride—in molten state and after heating), by platinum-cobalt scale, test, D 3366 (06.03)

color (of solid aromatic hydrocarbons/related materials—in molten state), by platinum-cobalt scale, test, D 1686 (06.03)

evaluating degree of bleeding of traffic/pavement marking paint, test, D 868 (06.01)

evaluation of painted/coated specimens subjected to corrosive environments, method, D 1654 (06.01)

formability/adhesion of zinc-rich primer/chromate complex coatings (on steel), test, D 4146 (06.01)

freeze-thaw resistance of water-borne coatings, test, D 2243 (06.01)

gloss differences between surfaces of similar appearance, method for visual evaluation, D 4449 (06.01)

gloss/sheen uniformity evaluation, test, D 3928 (06.01)

laboratory evaluation of degree of bleeding of traffic/pavement marking paint, test, D 969 (06.01)

MEK resistance of ethyl silicate (inorganic) zinc-rich primers, by solvent rub, test, D 4752 (06.01)

porosity of paint films (to indicate coating penetration), test, D 3258 (06.01)

relative tinting strength of white pigments, by visual observation, test, D 332 (06.02)

solution color of 4,4'-isopropylidenediphenol (dissolved in methanol), test, D 4789 (06.03)

subjecting marine antifouling coating to bifouling and fluid shear forces in natural seawater, test, D 4939 (06.01)

testing industrial water-reducible coatings, guide, D 4712 (06.01)

wet-to-dry hiding change of architectural coatings, test, D 5007 (06.01)

Visual examination—pipeline coatings

cathodic disbonding of pipeline coatings, accelerated procedure, test, G 8 (06.01)

effects of outdoor weathering on pipeline coatings, test, G 11 (06.01)

impact resistance of pipeline coatings, by limestone drop test, G 13 (06.01)

VM & P naphthas

VM & P naphthas, spec., D 3735 (06.03)

VOC abatement

amount of volatile organic compound (VOC) released from solventborne automotive coatings and available for removal in a VOC control device (abatement), test, D 5087 (06.01)

VOC calculation

volatile organic content (VOC) of paints/related coatings, selecting test procedures, practice, D 3960 (06.01)

Volatile acids content

sampling and testing pine tars/pine-tar oils, method, D 856 (06.03)

Volatile liquids

low viscosity, rate of evaporation, test, D 3539 (06.01)

Volatile matter content

calcium borosilicate, test, D 4487 (06.02)

cellulosics/emulsions/resin solutions/shellac/varnishes, selecting test procedures, practice, D 4209 (06.02)

driers/drying oils/naval stores and solvents, selecting test procedures, guide, D 4140 (06.03)

hygroscopic moisture (and other matter volatile under test conditions) in pigments, test, D 280 (06.02)

loss on heating of drying oils, test, D 1960 (06.03)

moisture content of pigments, D 1208 (06.02)

paint/raw paint material, practice, D 2832 (06.01)

paints (solvent-reducible), test, D 2369 (06.01)

sampling/testing lac resins (orange shellac/button lac/garnet lac/bleached lac), test, D 29 (06.02)

Index of ASTM Standards, Section 6

Volatile matter content

- sampling/testing volatile solvents/chemical intermediates (for paints/lacquer/varnish/related material), selecting test methods, **D 268 (06.03)**
- volatile content in phenolic resins, test, **D 4639 (06.02)**
- volatile matter in tricresyl phosphate, test, **D 1468 (06.03)**
- volatile/nonvolatile content (of pigments), selecting test procedures, guide, **D 4139 (06.02)**
- volatile organic content (VOC) of paints/related coatings, selecting test procedures, practice, **D 3960 (06.01)**
- Volatile organic compounds (VOC)—paints/related coatings**
 - dichloromethane/1,1,1-trichloroethane content in paints/coatings, by direct injection gas chromatography, test, **D 4457 (06.01)**
 - distillation range (between 30 and 350°C) of volatile organic liquids, test, **D 1078 (06.03)**
 - nonvolatile content in silanes/siloxanes/silane-siloxane blends used in masonry water-repellent treatments, test, **D 5095 (06.01)**
 - nonvolatile content of resin solutions (in volatile-organic solvents), test, **D 1259 (06.02)**
 - volatile oil in rosin, test, **D 889 (06.03)**
 - volatile organic compounds (VOC) of solvent reducible paints in aerosol cans, test, **D 5200 (06.01)**
 - volatile organic content (VOC) of paints/related coatings, selecting test procedures, practice, **D 3960 (06.01)**
- Volatile organic compounds (VOC)—paints/related materials**
 - calculating formulation physical constants of paints/coatings, practice, **D 5201 (06.01)**
- Volatile resin acids content**
 - See *Resins (headings)*
- Volatile solvents (in paints/coatings)**

- Water—sea water**
 - erosion testing of antifouling paints, using high velocity water, test, **D 4938 (06.01)**
 - organotin release rates of antifouling coating systems in sea water, using graphite furnace atomic absorption spectrophotometry (GF-AAS), test, **D 5108 (06.01)**
 - subjecting marine antifouling coating to biofouling and fluid shear forces in natural seawater, test, **D 4939 (06.01)**
- Water absorption**
 - comparative corrosion preventive characteristics of materials used for joints/couplings/fittings/patches in pipeline coatings, test, **G 18 (06.01)**
 - water penetration into pipeline coatings, test, **G 9 (06.01)**
- Water-base paints**
 - See *Latex paints*
- Water-channel method**
 - erosion testing of antifouling paints, using high velocity water, test, **D 4938 (06.01)**
- Watercolor paint**
 - See *Artists' paints*
- Artists' watercolor paints, spec., D 5067 (06.01)**
- Water content—paints/related coatings/materials**
 - cresylic acid content (of alkaline cresylate solutions), chemical analysis, **D 3439 (06.03)**
 - fatty nitrogen compounds, test, **D 2072 (06.03)**
 - Karl Fischer reagent method, test, **D 4017 (06.01)**
 - moisture content of pigments, **D 1208 (06.02)**
 - oil/water presence in compressed air (used for coating application/air blast cleaning/abrasive blast cleaning), **D 4285 (06.01)**
 - phenol/related materials, by iodine reagent method, test, **D 1631 (06.03)**
 - water content of water-reducible paints, by direct injection into gas chromatograph, test, **D 3792 (06.01)**
 - water in liquid naval stores, test, **D 890 (06.03)**
 - water in volatile solvents, by Fischer reagent titration method, test, **D 1364 (06.03)**
- Water content—petroleum products**
 - water in petroleum products/bituminous materials, by distillation, test, **D 95 (06.01, 06.03)**
- Water fog test**
 - testing water resistance of coatings, using water fog apparatus, practice, **D 1735 (06.01)**
- Water immersion**
 - resistance to failure of paints and related coatings, on steel surfaces, **D 870 (06.01)**
- Water-insoluble impurities content**
 - See *Impurities (headings)*
- Water-insoluble matter content**
 - apparent pH of water insoluble phenol-formaldehyde resin, test, **D 4613 (06.02)**
 - hydrogen sulfide/sulfur dioxide (qualitative) of industrial aromatic hydrocarbons, test, **D 2363 (06.02)**
 - methylcellulose, test, **D 1347 (06.02)**
- Water miscibility**
 - See *Miscibility*
- Water miscibility of water-soluble solvents, test, D 1722 (06.03)**
- Water of hydration**
 - calcium borosilicate, test, **D 4487 (06.02)**
- Water penetration**
 - water penetration into pipeline coatings, test, **G 9 (06.01)**
- Water pickup**
 - water pickup of lithographic printing inks/vehicles in a laboratory mixer, test, **D 4942 (06.01)**
- Water-reducible coatings**
 - testing industrial water-reducible coatings, guide, **D 4712 (06.01)**
- Water repellency**
 - wood products, qualitative test for, **D 2921 (06.01)**
- Water resistance**
 - See *Resistance—water*
- Water-soluble-matter content**
 - conductimetric analysis of water-soluble ionic contamination of blasting abrasives, test, **D 4940 (06.01)**
 - moisture content of pigments, **D 1208 (06.02)**
 - painting inspectors (metal substrates), guide, **D 3276 (06.01)**

- salt content of blue pigments, test, D 1135 (06.02)
 sampling/testing lac resins (orange shellac/burton lac/garnet lac/bleached lac), test, D 29 (06.02)
 water miscibility of water-soluble solvents, test, D 1722 (06.03)
 water-soluble salts in pigments, by measuring specific resistance of pigment leachate, test, D 2448 (06.02)
 yellow/orange/green pigments containing lead chromate/chromium oxide green, analysis, test, D 126 (06.02)
- Water-soluble solvents**
See Solvents (headings)
- Water spotting**
 reporting paint film failures characteristic of exterior latex paints, classification, D 1848 (06.01)
- Water vapor permeance**
 moisture vapor transmission of organic coating films, test, D 1653 (06.01)
- Water vapor transmission**
 moisture vapor transmission of organic coating films, test, D 1653 (06.01)
- Waxes**
 alcohol-benzene soluble matter in cellulose, test, D 1794 (06.02)
- Wear testing**
 resistance to wear of traffic paint, method, D 913 (06.01)
- Weathering**
 conducting tests on paint/varnish/lacquer/related products, using enclosed carbon-arc light/water exposure apparatus, practice, D 5031 (06.01)
 evaluation of painted/coated specimens subjected to corrosive environments, method, D 1654 (06.01)
 panel, recording results of exposure tests, single-/multi-panel forms, D 1150 (06.01)
- Weathering—accelerated and outdoor**
 accelerated testing of paints/varnishes/lacquers/related products, using filtered open flame carbon-arc light/water exposure apparatus, practice, D 822 (06.01)
 coatings (applied to metal substrates), practice, D 4141 (06.01)
 Dew cycle, light-water-exposure apparatus, practice for operating, D 3361 (06.01)
 testing water resistance of coatings, using water fog apparatus, practice, D 1735 (06.01)
- Weathering—outdoor**
 conducting exterior exposure tests of (exterior) paints on steel, test, D 1014 (06.01)
 conducting exterior exposure tests of house/trim paints on new/unpainted wood, practice, D 1006 (06.01)
 effects of outdoor weathering on pipeline coatings, test, G 11 (06.01)
 exposure of paints/related coatings to fluorescent UV-condensation light-water-exposure apparatus, practice for conducting tests, D 4587 (06.01)
 quantifying dirt collection on coated exterior panels, test, D 3719 (06.01)
 wood used as panels in weathering tests of coatings, spec., D 358 (06.01)
- Weight**
 impact resistance of pipeline coatings, by falling weight test, G 14 (06.01)
 paint/varnish/lacquer/related products, test, D 1475 (06.01)
 transfer efficiency under production conditions for spray application of automotive paints, by weight basis, practice, D 5066 (06.01)
 volume/weight of industrial aromatic hydrocarbons, method, D 1555 (06.03)
- Weight—weight loss**
 wet abrasion resistance of interior paints to scrubbing, by weight loss, test, D 4213 (06.01)
- Weight—weight-per-gallon cup**
 paint/varnish/lacquer/related products, test, D 1475 (06.01)
- Weight percent epoxide (WPE)**
 epoxy content of epoxy resins, test, D 1652 (06.02)
- Weight solids**
 calculating formulation physical constants of paints/coatings, practice, D 5201 (06.01)
- Weissenberg rheogoniometer test**
 viscosity of polymeric powders and powder coatings, practice, D 3451 (06.01)
- Welding/welds**
 design/fabrication of flue gas desulfurization system components (for protective lining application), spec., D 4618 (06.01)
- Western red cedar**
 wood used as panels in weathering tests of coatings, spec., D 358 (06.01)
- Wet film thickness**
See Film—wet film thickness
- Wet film thickness gage**
 wet film thickness of organic coatings, D 1212 (06.01)
- Wet ground muscovite mica**
See Stone—mica
- Wet-to-dry hiding change**
 wet-to-dry hiding change of architectural coatings, test, D 5007 (06.01)
- White architectural enamels**
See Architectural coatings
- White extender pigments**
See Extender pigments
- White hiding pigments**
See Antimony oxide/Basic carbonate white lead
See Basic sulfate white lead/Leaded zinc oxide
 Pigments (general properties)/Titanium dioxide
 Zinc oxide/Zinc sulfide
- White linseed oil paints**
 white linseed oil paints—chemical analysis, selecting test methods, practice, D 215 (06.01)
- White pigments—general analysis**
 analysis of white zinc pigments, test, D 3280 (06.02)
 antimony oxide content of white pigment (separated from solvent-type paints), test, D 2350 (06.02)
 basic carbonate white lead pigment, spec., D 81 (06.02)
 chemical analysis of white pigments, selection of test methods, guide, D 34 (06.02)
 particle size distribution, by hydrometer of common white extender pigments, test, D 3360 (06.02)
 ratio of anatase to rutile in titanium dioxide (TiO₂) pigments, by x-ray diffraction, test, D 3720 (06.02)
 relative tinting strength of white pigments, by reflectance measurements, test, D 2745 (06.02)
 relative tinting strength of white pigments, by visual observation, test, D 332 (06.02)
 sulfide in white pigment separated from solvent-reducible paints, test, D 2351 (06.02)
 sulfur dioxide in white pigment separated from solvent-reducible paints, test, D 2352 (06.02)
 white lead—chemical analysis, test, D 1301 (06.02)
 white linseed oil paints—chemical analysis, selecting test methods, practice, D 215 (06.01)
 white titanium pigments, chemical analysis, test, D 1394 (06.02)
 zinc oxide pigments, spec., D 79 (06.02)
- White pine**
 wood used as panels in weathering tests of coatings, spec., D 358 (06.01)
- White zinc pigments**
See Zinc oxide
- Whiting**
See Calcium carbonate
- Wick test**
 sustained burning (of low viscosity liquid mixtures), by Wick test, D 4207 (06.03)
- Wijs procedure—iodine value**
 drying oils and their derivatives, test, D 1959 (06.03)

Index of ASTM Standards, Section 6

Wijs procedure—iodine value

fatty amines/diamines, test, D 2075 (06.03)

Wire-wound drawdown bar method

coil coatings, application using a wire-wound drawdown bar, practice, D 4147 (06.01)

Wolfe-potentiometric method

oleic acid content of tall oil rosin, test, D 1585 (06.03)

Wood and wood products

chlorinated phenol preservative content in wood products, qualitative test, D 2921 (06.01)

temperature of applied coatings on wood products during the curing cycle, by infrared radiation thermometers, practice, D 3259 (06.01)

wood used as panels in weathering tests of coatings, spec., D 358 (06.01)

Wood and wood products—cellulose pulp

metals (iron/copper/manganese/calcium) content of cellulose pulp (from wood/cotton), by atomic spectrophotometry, test, D 4085 (06.02)

pentosans content of cellulose, test, D 1787 (06.02)

Wood and wood products—composites

edge performance of composite wood products under surfactant accelerated moisture stress, test, D 2065 (06.01)

Wood and wood products—heartwood

wood used as panels in weathering tests of coatings, spec., D 358 (06.01)

Wood and wood products—paints/related coatings

block resistance of organic coatings, test, D 2793 (06.01)

conducting exterior exposure tests of house/trim paints on new/unpainted wood, practice, D 1006 (06.01)

dry film thickness, by microscopical measurement, D 2691 (06.01)

factory-primed, durability and compatibility, with finish coatings, test, D 2830 (06.01)

humid-dry cycling (for coatings on wood/wood products), method, D 3459 (06.01)

specifying properties of paint from the liquid-state through the curing stage for factory applied coatings on wood products, practices, D 2336 (06.01)

Wood preservatives

chlorinated phenol preservative content in wood products, qualitative test, D 2921 (06.01)

Wood rosin

See Rosin

See Oils (headings)

Wood turpentine

See Turpentine

X

Xenon lamps

lightfastness of pigments (in artists' paints), test, D 4303 (06.01)

operating light-exposure apparatus (xenon-arc type) with/without water for exposure of nonmetallic materials, practice, G 26 (06.01)

X-ray diffraction

ratio of anatase to rutile in titanium dioxide (TiO₂) pigments, by x-ray diffraction, test, D 3720 (06.02)

Xylene

acidity of benzene/toluene/xylenes/solvent naphthas/similar industrial aromatic hydrocarbons, test, D 847 (06.03)

acid wash color, test, D 848 (06.03)

aromatic hydrocarbons/related chemicals, terminology, D 4790 (06.03)

distillation, test, D 850 (06.03)

flash/fire point of liquids, by Tag open-cup apparatus, test, D 1310 (06.03)

impurities in high-purity ethylbenzene, by gas chromatography, test, D 5060 (06.03)

purity of hydrocarbons from freezing points, test, D 1016 (06.03)

sampling/handling liquid cyclic products (at ambient temperature), practice, D 3437 (06.03)

total non-aromatic/trace monocyclic hydrocarbon aromatic hydrocarbons in high-purity benzene/toluene/mixed xylenes, by gas chromatography, test, D 2360 (06.03)

volume/weight of industrial aromatic hydrocarbons, method, D 1555 (06.03)

xylene isomer analysis, by gas chromatography, test, D 2306 (06.03)

xylenes for *p*-xylene feedstock, spec., D 5211 (06.03)

meta-Xylene

apparent density of industrial aromatic hydrocarbons, test, D 2935 (06.03)

commercial density (of pure liquid chemicals), test, D 3505 (06.03)

volume/weight of industrial aromatic hydrocarbons, method, D 1555 (06.03)

ortho-Xylene

apparent density of industrial aromatic hydrocarbons, test, D 2935 (06.03)

commercial density (of pure liquid chemicals), test, D 3505 (06.03)

purity, by gas chromatography, test, D 3797 (06.03)

volume/weight of industrial aromatic hydrocarbons, method, D 1555 (06.03)

o-xylene 950, spec., D 4076 (06.03)

para-Xylene

analysis of *p*-xylene, by gas chromatography, method, D 3798 (06.03)

apparent density of industrial aromatic hydrocarbons, test, D 2935 (06.03)

commercial density (of pure liquid chemicals), test, D 3505 (06.03)

high purity *p*-xylene, spec., D 5136 (06.03)

trace (total) chloride (organic/inorganic) in liquid aromatic hydrocarbons, test, D 5194 (06.03)

volume/weight of industrial aromatic hydrocarbons, method, D 1555 (06.03)

xylenes for *p*-xylene feedstock, spec., D 5211 (06.03)

Xylene (five-degree)

xylene isomer analysis, by gas chromatography, test, D 2306 (06.03)

Xylene (mixed)

apparent density of industrial aromatic hydrocarbons, test, D 2935 (06.03)

commercial density (of pure liquid chemicals), test, D 3505 (06.03)

volume/weight of industrial aromatic hydrocarbons, method, D 1555 (06.03)

Xylene (nitration grade)

xylene isomer analysis, by gas chromatography, test, D 2306 (06.03)

xylene (nitration grade), spec., D 843 (06.03)

Xylene (ten-degree)

xylene isomer analysis, by gas chromatography, test, D 2306 (06.03)

Xylenol

water content, by iodine reagent method, test, D 1631 (06.03)

Y

Yellow ochre

See Ocher

Yellow pigments

chrome yellow/orange pigment, spec., D 211 (06.02)

yellow iron oxide (hydrated), spec., D 768 (06.02)

yellow/orange/green pigments containing lead chromate/chromium oxide green, analysis, test, D 126 (06.02)

Yield value

laboratory preparation of gelled vehicles, using microwave oven,
practice, D 5166 (06.02)

Z**Zahn viscometers**

See Viscometers—Zahn

Zeisel technique

ethoxyl substitution in cellulose ether products, by gas
chromatography, test, D 4794 (06.02)
gas chromatographic analysis of methoxyl/hydroxypropyl
substitution, in cellulose ether products, test,
D 3876 (06.02)

Zinc

liquid paint driers, selection of test methods, D 564 (06.03)

Zinc chromate (yellow)

analysis, D 444 (06.02)
zinc yellow (zinc chromate) pigments, spec., D 478 (06.02)

Zinc-coated (galvanized) surfaces

preparation for painting, practice, D 2092 (06.01)

Zinc content

analysis of white zinc pigments, test, D 3280 (06.02)
paint driers, by EDTA method, test, D 2613 (06.03)
zinc dust (metallic zinc powder), test, D 521 (06.02)
zinc yellow (zinc chromate yellow) pigment, test, D 444 (06.02)

Zinc driers

See Driers

Sa Oils—drying**Zinc dust****Sa Pigments (general properties)**

analysis, D 521 (06.02)
zinc dust pigment, spec., D 520 (06.02)

Zinc hydroxy phosphite

analysis, D 4450 (06.02)
zinc hydroxy phosphite pigment, spec., D 4462 (06.02)

Zinc oxide—pigment

analysis of white zinc pigments, test, D 3280 (06.02)
zinc oxide pigments, spec., D 79 (06.02)

Zinc oxide content

zinc hydroxy phosphite, test, D 4450 (06.02)

Zinc-rich primer**Sa Primer**

MEK resistance of ethyl silicate (inorganic) zinc-rich primers,
by solvent rub, test, D 4752 (06.01)

Zinc sulfide

analysis of white zinc pigments, test, D 3280 (06.02)

Zinc white

See Zinc oxide—pigment

Zinc yellow

See Zinc chromate (yellow)

Zirconium content

paint driers, by EDTA method, test, D 3969 (06.03)

ZTO chromate

See Zinc chromate (yellow)

1992 MEMBERSHIP APPLICATION

THIS APPLICATION IS FOR SOCIETY MEMBERSHIP ONLY.

EACH TECHNICAL COMMITTEE REQUIRES A SEPARATE APPLICATION.

PLEASE SEND APPLICATIONS FOR THE FOLLOWING

COMMITTEE (S) _____

APPLICATION IS MADE FOR MEMBERSHIP IN ASTM:

SEE BENEFITS AND FEES ON REVERSE SIDE

☐ MEMBER

AN INDIVIDUAL, GOVERNMENT REPRESENTATIVE, OR AN INSTITUTION (EDUCATIONAL, PUBLIC LIBRARY, OR A SCIENTIFIC ENGINEERING, OR TECHNICAL NON-PROFIT SOCIETY) SUBSCRIBING TO THE PURPOSES OF THE SOCIETY PROVIDED IN THE CHARTER AND BYLAWS.

☐ ORGANIZATIONAL

AN INDIVIDUAL, BUSINESS, GOVERNMENTAL, RESEARCH, OR PROFESSIONAL ORGANIZATION, OR TRADE ASSOCIATION, OR SEPARATE FACILITY THEREOF SUBSCRIBING TO THE PURPOSES OF THE SOCIETY PROVIDED IN THE CHARTER AND BYLAWS.

PLEASE PRINT ALL INFORMATION CLEARLY. DO NOT EXCEED THE CAPACITY OF EACH LINE.

ATTN: MEMBER SERVICES

BENEFITS AND FEES FOR 1992

	<u>Organizational</u>	<u>Member</u>
Annual Fee	\$350.00 ^{††}	\$50.00 ^{††}
Participation on ASTM Technical Committees	One Official Rep. Only	Member Only
Annual Book of ASTM Standards	One Free Volume	One Free Volume
Complete Set of Book of ASTM Standards (Vols. 1-68)	\$3,500.00 (Prepaid) [†]	\$3,900.00 (Prepaid) [†]
Individual Book of Standards at Member Price	No Limit	None
Complete Sections at Member Price (Prepaid)	No Limit	No Limit
Other Publications at Member prices	No Limit	No Limit
Annual Subscription to <i>Standardization News</i>	1 Free	1 Free

* Of the \$350 Administrative fee payment, \$300 is tax deductible as a charitable contribution for federal tax purposes. The remaining \$50 may be deducted as an ordinary and necessary business expense.

** Administrative fee payments made to ASTM are not tax deductible as charitable contributions for federal income tax purposes. They may be deductible as ordinary and necessary business expense.

† Canadian Prospective Members - Please add 7% GST - Registration Number R129162244.

MEMBERSHIP

- Membership year is January 1 to December 31. Fees are payable in advance and are not prorated. Membership will become effective upon payment of fees.
- Organizations applying for membership should select one official representative qualified to exercise the rights and privileges of membership. This includes voting on Society Ballot, and if appropriate, on technical committee matters.
- Only the official representative may participate on committees under the organizational membership. All others must maintain individual memberships in order to participate on committees.
- The official representative for the organizational membership may be changed as needed by notifying ASTM Headquarters. Committee participation is not transferable. An application will have to be submitted by the new representative for the appropriate committees. A member not officially serving on ASTM committees may not vote in committee matters.
- For members serving on technical committees, each organization may ask that the membership be transferred without payment of additional fees, if the fees were paid by the company. However, no additional free volume of the Book of ASTM Standards will be allowed. Committee participation is not transferable. An application will have to be submitted by the new member of the appropriate committee.

PUBLICATIONS

- All publications must be shipped to the member.
- Shipping and handling costs will not be charged for prepaid orders shipped to the U.S. and Canada.

NOTE: Membership benefits and publication prices are subject to change.
