Date November 15, 1979
Subject VCM DOSIMETRY - OCTOBER, 1979

RECEIVED
NOV 28 1979

Following are the results of VCM dosimetry during October, 1979. 69 samples were taken, 12 of which indicated overexposure.

<u>Range, PPM</u>	<u>No. Samples</u>	<u>Percent</u>
0.0 - 0.5	49	71.01
0.5 - 1.0	8	11.59
1.0 - 5.0	10	14.49
5.0+	2	2.90
	<u>69</u>	<u>100.00</u>

The results of the 12 overexposures appear in Table I.

The new record system, started at mid-month, is yielding better information on probable causes of overexposures. This is because the worker being monitored is required to report the most likely causes of overexposures on the day he is monitored.
