We have made two more analysis of aqueous streams to determine the content of Arochlor 1254. The results are as follows:

10/17/69, Decanter of Bldg 408 6,500 ppb

10/23/69, East Ditch 1.3 ppb

The relatively high level of Arochlor 1254 of the decanter and its sporadic overflow explains the variations of Arochlor 1254 monitored which has been reported on October 13. The problem has been corrected since one week after prevention of overflow of the decanter, the total east ditch shows 1.3 ppb. This is the lowest amount found in this ditch during the month of October. Since the techniques of analysis are extremely delicate, we have dedicated one instrument for this purpose. We are planning to use this instrument in another analysis. Consequently, we plan to analyze samples only at your request rather than weekly analysis.
