FILE-Reclamation

Larry, arrangements have been initiated through J. Savage, Toby Bell and Joe Landwehr to evaluate Pydraul removal from waste water at Anniston. Results would be used to intelligently recommend to our Pydraul customers effective means to control unavoidable Pydraul water wastes. Should you want to pursue this program the following comments may be helpful.

Equipment available at Anniston for Pydraul removal efficiency include a carbon absorption column, a rented Biodize separator and a pilot scale reactor-clarifier system. Pertinent correspondence on this equipment and Anniston's current program is attached. Based on our customer effluent sampling program in 1970 I have recommended to Anniston that the stream be seeded with 50-100 ppm Pydraul (Pydraul F-9-A specifically.) Removal efficiencies of the equipment (individually and in series) can then be assessed. Other fluids, i.e., our NC ester, could be evaluated depending on Pydraul F-9-A results.

For the program to go, arrangements should be firmed with Manufacturing, Research and Anniston on the equipment testing sequence and timing. Secondly, arrangements should be made with Applied Services (E. Tucker) to analyze the treated Pydraul F-9-A specimens.
