We appreciate your help and agreement to compare four Monsanto plasticizers with competitive plasticizers now being used for permanence in PVAc adhesives. Santicizers 262, 278, 462 and 464 are the products we would like to have compared with Resoflex 296, Hercoflex 900 and Harflex 340. Samples of these seven products have been sent to Dan Sullivan.

Our objective is to provide a permanent plasticizer for PVAc adhesives. The properties we would like to have compared are compatibility, volatility, migration, water resistance, wet tack and bond strength. There are probably other properties that you know of that are important for this application. We would appreciate evaluations of any other properties you feel should be checked such as dispersability, etc.

In addition to the comparison data, we would appreciate your opinion and comments as to the advantages and disadvantages of our plasticizers versus the competitive products. Do we have a good product from these four candidates?

Would you please let me know when this work can be completed?
Thank you again for your help and cooperation?
