On February 13, Mr. Ed Raab, of General Electric's Group Technical Resources Operation, phoned me to state that General Electric Company has again ~~officially committed~~ itself to ~~stay in the Pyranol (PCB) transformer business~~, after a three month management consideration.

One of the reasons for this survey was, of course in part, EPA setting of standards for PCB's as toxic pollutants.

General Electric considers that the standards are unrealistic and they will work aggressively to get them modified to an acceptable level by all means possible to them. Mr. Raab stated they were planning an intense lobbying campaign as well as presentation of technical logic.

Further General Electric advised that ~~if they are not successful in getting the standards changed~~, and since the standards will become law in July 1975, it is ~~most probable~~ that General Electric will go to court ~~against the EPA~~. They will at that time ~~most likely ask Monsanto, National Electric Manufacturers' Association and perhaps Westinghouse to join with them.~~

Mr. Raab and General Electric is totally familiar with our position and statements to the EPA which, in general, support General Electric's thinking.

The General Electric executives taking this position are Mr. Art Peltasalo, Group Vice President and Mr. C. J. Meloun, Vice President, Transformers, Pittsfield.

Mr. Raab also reviewed items which have been previously reported by Mr. Paul Benignus, in his memo dated February 8, 1974 to Cuming Paton, subject "Transformer Pyranol."

This memorandum is attached. Appropriate actions are being taken on other matters in this memo.
