Subject: WASTE VCM ADSORPTION

Interoffice
Communication

VISTA

Presently VCM Stack Emission from the Aberdeen PVC Plant are among the highest in the S-PVC industry. An Activated Carbon Adsorption System, as a replacement to External Steam Stripping, would place Vista's VCM Stack Emissions in the middle of the pack for S-PVC plants.

The preliminary design for the Waste VCM Adsorption Project is being issued for estimation. Currently, VCM Stack Emissions are about 180 #VCM/day. An Activated Carbon Adsorption System could lower VCM Stack Emissions to approximately 25 #VCM/day.
