May 25th, 1943

Dr. Robert Kehoe
Kettering Laboratory
University of Cincinnati
Eden Avenue
Cincinnati, Ohio

Dear Doctor Kehoe:

Last week we sent several urine and blood specimens to you on employees from Department ABS. They are all patients on whom you had received previous specimens.

[REDACTED] ABS-128, has been receiving intravenous therapy with calcium gluconate and intramuscular liver extract since April 29th. Her last blood count, on May 14th, 1943, was as follows:

R.B.C.	4,080,000
Hemoglobin	84%
Stippling	63/50 F

On May 26th, we had a check count at Bridgeport Hospital where they found she had a R.B.C. of 5,050,000 with 115% Hemoglobin. She still has headache and some weakness. The physician who has been treating her on the outside as consultant for us discovered the presence of a large fibromyoma of the uterus. She is to have that removed this morning.

[REDACTED] ABS-22, still complains of weakness and malaise. She is sleeping better than previously. Constipation has appeared, but the sweetish taste in her mouth has decreased. Her blood pressure is now 180/110. Arthralgia and myalgia have become outstanding and are annoying to her. Laboratory examination at this time reveals:

R.B.C.	4,370,000
Hemoglobin	84%
Stippling	44/50 F

It is interesting to note that she showed a sedimentation rate of 23 mm per hour (normal for women, by this method is 10 mm per hour).

Neither Mrs. [REDACTED] nor Mrs. [REDACTED] has returned to her job since her original absence.

(continued)

-2-

[REDACTED] ABS-106, has been back at work since April 19th. She is not working in the same area, but in one completely dissociated with lead. She has a lessened pallor, better appetite, etc. Her mental status has not improved, but that is apparently a congenital affair. Her laboratory examination at present reveals:

R.B.C.	4,400,000
Hemoglobin	78%
Stippling	205/50 F
Urine, Alb. 0	Sugar 0

Today a urine and blood specimen were obtained on an employee of A.B.S. whose name was not given to us on our original survey of that area.

[REDACTED] ABS-108, is a 21 year old, white female who has been employed in this area for two years. On her initial physical examination in March 1941, nothing of note was found except for acne vulgaris of face, and dental caries. At this time hemoglobin was 93% and albumin was found in the urine. In May of that same year she had a transient complaint of upset stomach. In March 1942, her hemoglobin was 84% and a plus-minus albumin was found in the urine. The carious teeth had been extracted. In December, 1942, a routine lead check-up was done. Constipation was noted. Laboratory examination revealed:

R.B.C.	4,110,000
Hemoglobin	82%
Stippling	50/50 F
Urine, Alb.	Plus

Today she came in for her annual examination and, in the course of routine questioning, weakness and malaise were noted. Further interrogation revealed sweetish taste in mouth, marked malaise and weakness and recent onset of mental excitement. Questionable pallor and drawn expression were present. Laboratory examination revealed:

R.B.C.	4,450,000
Hemoglobin	83%
Stippling	130/50 Fields
Urine, Alb.	Negative.

A urine and blood were taken this morning for examination by your Laboratory.

Sincerely yours,

G. V. Mitchell, M. D., Medical Supervisor

By:

Mary M. Maher
Mary M. Maher, M. D.

P.S. In view of the line organization at Remington it would seem advisable in the future to address your letters to Dr. Mitchell, rather than to me.
