Copy to Messrs. Cowan, MacDonald, Maxwell Reference

Subject ASBESTOS - CALSILITE FURNISH

As per previous conversation at our conference in Mr. Abraham's office on Tuesday, the 20th; we were instructed to simplify our asbestos mix in Calsilite to approximately 40% M-1 Amosite, 30% DS Amosite and 30% Canadian 4T.

We are to establish an interim formula with approximately the above asbestos content and as soon as we have established such a formula we are to advise Mr. Abraham in exact detail as to its composition. This formula is then not to be altered in any respect without Mr. Abraham's specific approval.

This change in asbestos will ultimately leave you with a surplus of blue, DS/M1 and AS, and there may be some other miscellaneous stock. In due course Mr. MacDonald should be advised of what this surplus is. You should then also recheck your requirements for the balance of the year so that you will have sufficient of each of the desired grades on hand for your production.
