Dear Mr. Barr:

Thank you very much for your recent letter regarding the interpretation of the hand x-rays. For 401-34-9331 the term developmental suggests that this is a congenital variation in development and has no relation to acro-osteolysis. With regard to 376-01-3907, a marginal defect was apparent, but it was not characteristic of those which we have seen with acro-osteolysis and therefore was thought to be of questionable significance. I don't think that either of these are related to acro-osteolysis. No further studies are indicated at this time.

If you have any further questions, please do not hesitate to let us know.

Sincerely yours,

Walter M. Whitehouse, M.D.
Professor and Chairman
Department of Radiology
