STRUCTO-LITE AND OTHER LIGHTWEIGHT AGGREGATED PLASTERS

Field experience has shown that plasters using lightweight aggregates frequently do not have adequate strength on metal lath to resist cracking when subjected to structural movement or other stresses and impacts.

Recommendations for using STRUCTO-LITE or other gypsum cement plasters aggregated with perlite and/or vermiculite as a scratch and brown coat plaster over METAL LATH have been REMOVED from all USG literature including the A.I.A. Technical Information brochures.

Please refer to revised literature before making recommendations. We also suggest that you review with your architects and contractors.
