Gentlemen:

Our automotive section is presently studying the use of your experimental Anti-Knock Compound AK-33-X.

It is my understanding that a brochure is available on the properties of this substance entitled "Laboratory Use of Ethyl Anti-Knock Compound, Experimental AK-33-X".

Would you be so kind as to send me a copy of the above mentioned material.

Since I am especially interested in the toxicological aspects of the use of AK-33-X, I would also appreciate any additional information on this product which may be available to include range-finding toxic studies on animals relative to respiratory, gastrointestinal and skin absorption as well as skin and eye irritation. A statement of human experience with AK-33-X including any warning characteristics, injuries from any type of exposure and suggested treatment would be appreciated. I appreciate the fact that information relative to animal and human exposure may still be fragmentary and under study, therefore, I would appreciate being kept up to date on these developments as they progress and the commercial properties of AK-33-X are further explored.

Cordially yours,

Lamson Blaney M.D.
