In 1980, Du Pont was first in the chemical industry to institute an asbestos-screening program for all employees and pensioners. As a part of this program, the Rochester Plant specifically monitors all employees with potential for exposure to asbestos as a part of the periodic physical examination for employees. The examination includes a full chest x-ray, which is read and interpreted by a board certified radiologist, and a pulmonary function test.

Corporate Medical recently assisted in an audit of all the x-rays of employees and pensioners in our monitoring program. This review, done by a board certified radiologist, trained in detecting abnormalities that may be asbestos-related, indicates that 11 people have abnormalities which require follow-up as per our procedure. Even though our local board certified radiologists have not indicated these employees have abnormalities that are possibly asbestos-related, we will send these people, at our expense, to a pulmonary specialist for consultation. In addition, the corporate audit indicated that 24 x-rays should be retaken because the quality of the film was not acceptable for definitive reading. *for possible asbestos-related findings* additional views were required.

Dr. Auerbach will meet personally with all employees and pensioners involved to specifically review their circumstances with them.
