

SEND FOR BOOKLET

Without charge we will send you this booklet describing the advantages of Sabinite Acoustical Plaster. It includes illustrations and data on some of the many successful Sabinite installations.

New Sabinite Improvements

Lower unit cost of sound absorption

Architects find Sabinite Acoustical Plaster more economical than ever

ARCHITECTS who are called upon to specify materials for controlling sound, know Sabinite, the USG Acoustical Plaster, as the low cost treatment for noise absorption. Now the noise absorbing qualities of Sabinite have been still further increased in this new product called "Sabinite A". Its covering capacity has been greatly extended; its application simplified. Greater latitude is now permitted in the treatment of the finish coat of Sabinite. It

may be applied in a "trowel" finish as well as "floated" or "broomed" finish. Comes in white and four standard colors, ecru, ivory, cream and buff. Special colors will be prepared upon request.

Sabinite is adapted for absorbing disturbing noises in virtually every type of building where a plaster finish is suitable; in churches, schools, hospitals, banks, theatres, restaurants and in club and office quarters of all kinds. For places such as natatoriums where excessive moisture prevails, a special Sabinite Plas-

ter has been perfected. Both types are fire-proof, durable and completely sanitary.

Sabinite is applied by the plastering contractor. To forestall the possibility of misapplication, a USG Service Man is supplied to instruct the plasterer and the architect's superintendent on every Sabinite job. For further information on improved Sabinite, please write for the new booklet pictured above. Or send for our booklet describing the complete USG Sound Control Service. Address the United States Gypsum Company, Dept. 4311, 300 West Adams Street, Chicago, Illinois. In Canada, Dominion Gypsum Co., Ltd., Toronto, Ontario.
