

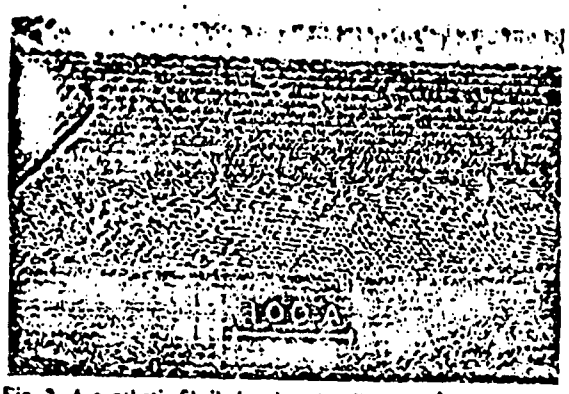

Fig. 3. A synthetic fibril showing the tilted 4·5 Å fringes with a relatively large tilt angle of 6° in the middle.

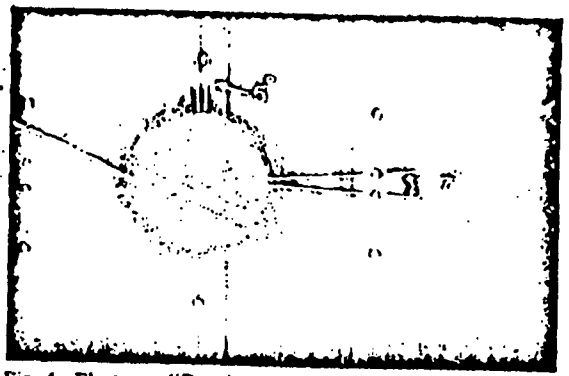

Fig. 4. Electron diffraction pattern from a synthetic fibril showing the tilted 4·5 Å fringes.

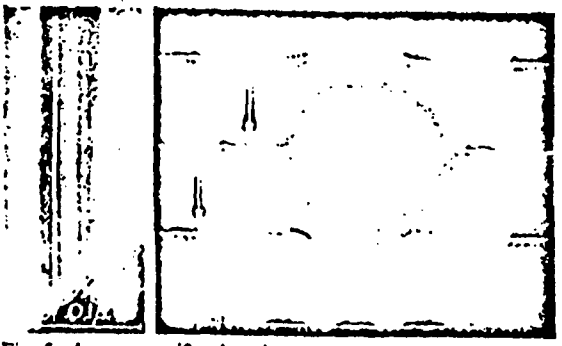

Fig. 5. Low magnification image of two adjoining fibrils having the vacant and the periodically filled intrafibril voids with the corresponding electron diffraction pattern. Diffraction spots indicated by arrows suggest that the 4·5 Å fringes of one of these fibrils are tilted and those of other are parallel (Transvaal sample).
