Attached for your information is a summary of results, by the Massachusetts Dept. of Public Health, of the health study of workers at G.E.'s Pittsfield plant. (I believe this is the one Steve Hamilton et al of G.E. discussed with several of us.)

The main conclusion is that "there are no specific links between bladder cancer and employment at General Electric Company." The study also found substantial exposure to transformer oils at G.E. but said that there is "no previous evidence of an association between bladder cancer and transformer oils."
