Lithopone
Light Resistance

File

We have just completed the examination of Glidden's 15 grades of lithopones which we received recently, for light sensitivity. All their grades show excellent resistance to ultraviolet light. We have two or three grades only that show a good degree of light resistance, with some grades quite severe in the degree of darkening.

Laboratory work of additions of cobalt are being conducted to determine, on a small scale, the minimum amount to use. We should have some results the early part of next week.
