Subject: Air Sampling Field Test -
Associates

3787

Gentlemen:

On June 9, I accompanied Mr. Bradley in
air samples were taken with both theidget imp...
membrane filter technique in the following areas:

1. In a large office containing some 100 people on the 6th floor of the Federal Office Building in Newark. This consisted of a sprayed fiber ceiling, under which is a hung mineral fiber acoustical ceiling, and the plenum is being used for air return. Sampling was taken at desk level.
2. A test in the corridor on the 8th floor.
3. A test in the U. S. Post Office lobby. This building is directly across from the Federal Office Building and is an all concrete construction.
4. A test outside in the park mid-way between the two buildings.
5. At the TWA Terminal Building at Kennedy Airport, which is an exposed sprayed fiber ceiling, directly under the main dome and at head level where the people are sitting down.
6. At the Information Desk about 10 feet from the entrance doors and directly under the exposed sprayed fiber ceiling.
7. Outside, and about 50 feet from entrance to the TWA Terminal, again at head level.

Mr. Bradley will call when he obtains the results, and we can then determine how a report should be written.
