Dutch Boy Linseed Oil STANDOIL TYPE

This standard type of Dutch Boy Linseed oil contains nothing but pure linseed oil. The oil, however, has been specially treated to produce a bodied oil. Its name "standard type" is derived from the use of that term by the Dutch to identify linseed oil that has been bodied by special processes, a type of oil that has been long used in the preparation of high grade paints.

This new DuPont Dry product mixes easily and rapidly with white lead. It will give improved gloss and improved breaking quality to your paint. It is also intended to remove some of the difficulties usually experienced by painters due to adverse weather and surface conditions. In other words, it represents our more forward step in supplying painters with materials that effectively back up their skill in the performance of the best painting possible. It does not supplant in any way the painter's exercise of skill and judgment in the application of his paint on which so much in the way of good results depends.

These May flowers are standard type—can be used in place of any brand of following our samples

pointing formula. I take more conditions, it may require a slight increase in the proportion of turpentine for proper working quarters but in no case should enough turpentine be added to counter exactly the slight pull which a heated oil of this kind gives to paint and which is desirable for best results. The oil contains no driers of any kind and the usual proportion of French Oil liquid drier (one-third pint to a gallon of oil) should be added by the painter.

Try this new oil on your next service job. You will find that it mixes easily and quickly; that it works nicely and gives you the type of job that satisfies your goals of craftsmanship and upholds your reputation as a Clean Boy garage.
