

From the desk of

DR. ROBERT A. KEHOE

*

In as much as lead occurs in
measurable concentrations
in the atmosphere in areas remote

from urban and industrial centers, because
of the particles of dust from the roads
and since the combustion of coal, wood and waste

of vegetable origin contributes lead
to the atmosphere, the increment provided
by the combustion of tetraethyl lead is
indeterminate. Finally, the movements
from all sources are subject to the vagaries
of wind, weather and the earth's topography,
and therefore any attempt at the interpretation
of the results of the analysis of atmospheric
samples is fraught with serious difficulties

of many factors
