"A smooth, even coating for coated stocks"

● That's what production men are saying about Titanox-B (barium base). This fine white pigment does not clog nor thicken in the machine because it has excellent mixing and dispersing qualities. It can be easily mixed with china clay, satin white or blanc fixe to produce stocks that are whiter and more opaque. • For making super and coated stocks of both light and medium weights, Titanox-B (barium base) produces better results because it offers these important properties: (1) high index of refraction; (2) remarkable brightness; (3) fine particle size; (4) chemical inertness; (5) high bulking value. • You'll also find that Titanox-B is uniform in color and particle size and free from objectionable foreign matter. Tests at all important steps of manufacture insure a product of highest purity and quality. • Let our research staff cooperate with you in improving your stocks. Write today for helpful information.

TITANIUM PIGMENT CO., INC.
Manufacturers of
TITANOX-B (Barium Base)
TITANOX-C (Calcium Base)
PURE TITANIUM OXIDE
