FINAL REPORT

Study Title:

104-Week Dietary Chronic Toxicity and Carcinogenicity Study with Perfluorooctane Sulfonic Acid Potassium Salt (PFOS; T-6295) in Rats

Author:

Peter J. Thomford, PhD

Study Completion Date:

January 2, 2002

Testing Facility:

Covance Laboratories Inc.
3301 Kinsman Boulevard
Madison, Wisconsin 53704-2595

Laboratory Study Identification:

Covance 6329-183

Sponsor Study Identification:

3M T-6295

FINAL REPORT

Study Title:

104-Week Dietary Chronic Toxicity and Carcinogenicity Study with Perfluorooctane Sulfonic Acid Potassium Salt (PFOS; T-6295) in Rats

Author:

Peter J. Thomford, PhD

Study Completion Date:

January 2, 2002

Testing Facility:

Covance Laboratories Inc.
3301 Kinsman Boulevard
Madison, Wisconsin 53704-2595

Laboratory Study Identification:

Covance 6329-183

Sponsor Study Identification:

3M T-6295

CELL PROLIFERATION REPORT

104-WEEK DIETARY CHRONIC TOXICITY AND CARCINOGENICITY STUDY WITH PERFLUOROOCTANE SULFONIC ACID POTASSIUM SALT (PFOS;T-6295) IN RATS COVANCE STUDY NUMBER 6329-183

PURPOSE

The purpose of the study was to assess the chronic toxicity and carcinogenicity of the test material when administered in the diet to rats for at least 104 weeks.

This report, submitted by Pathology Associates International (PAI) to the study Sponsor, 3M, represents the cell proliferation findings and interpretation for Covance Study Number 6329-183 entitled "104-Week Dietary Chronic Toxicity and Carcinogenicity Study with Perfluorooctane Sulfonic Acid Potassium Salt (PFOS; T-6295) in Rats". All aspects of the tasks associated with PAI's portion of this study were conducted in compliance with the Environmental Protection Agency Good Laboratory Practice (GLP) Regulations as set forth in Title 40 of the US Code of Federal Regulations, Part 792, issued November 29, 1983 (effective December 29, 1983), and any applicable amendments with the following exception. An expired reagent was used in the BrdU immunohistochemistry staining procedure (mouse IgG, Vector, lot # PK-4002, PAI No. K351, exp. 4/9/99). The staining was judged to be satisfactory; therefore, this GLP deviation does not impact the scientific validity of the study.

MATERIALS AND METHODS

Proliferating Cell Nuclear Antigen (PCNA) Staining and Evaluation

Tissue Collection for Cell Proliferation

Five animals per sex per group in groups 1 through 5 were sacrificed at weeks 4 and 14 for hepatocellular proliferation. A section of the left lateral lobe of the liver from each of 5 rats per group (groups 1-5) was fixed in zinc formalin, processed, and embedded to paraffin block by Covance per protocol specifications. Tissue blocks were shipped to PAI for sectioning and staining. From each block, a slide was prepared for H&E evaluation and immunohistochemical detection of proliferating cell nuclear antigen (PCNA), an endogenous marker of cell proliferation.

Immunohistochemistry for Cell Proliferation

Sections of paraffin-embedded tissues were cut at 5 μm and placed on positively charged slides (Superfrost Plus, Fisher Scientific, Pittsburgh, PA) to ensure adhesion during processing for PCNA. Standard immunohistochemical methods were used to stain tissues for PCNA [PAI's Standard Operating Procedure for Immunohistochemical Staining (SOP #707)]. Briefly, tissue sections were incubated with a monoclonal antibody to PCNA (DAKO, lot #016; PAI No.

A1899) and reagents required for the avidin-biotin peroxidase (ABC Kit; Vector, lot #PK-6100; PAI No. K 327) method for the detection of the antigen-antibody complex. PCNA expression in cells in all phases of the cell cycle (G_1, S, G_2 and M) was localized by the chromagen 3,3'-diaminobenzidine (DAB; Sigma Chemical Co., lot #18H8201). Tissue sections were counterstained with hematoxylin.

Cell Proliferation Measurements

The percentage of proliferating cells (proliferating index, PI) was determined by scoring at least 2000 hepatocytes in at least 6 fields of liver. In most cases, at least 3000 hepatocytes were scored in 10 fields, but in four animals there was insufficient tissue present on the slide to be able to score as many cells. Slides were first perused at low magnification (100X) to judge quality of staining, processing and sectioning, and pattern of cell labeling (e.g., centrilobular or panlobular, extrahepatocellular proliferation, such as Kupffer cells, bile duct epithelium, endothelium), and histomorphologic changes. The latter was further assessed by evaluating the serial H&E slide for each animal evaluated for cell proliferation. Cell proliferation was then quantified at higher magnification (200X) as described above.

A negative control slide was included in the staining run and consisted of study tissue from animal #C93008 that was not incubated with the primary antibody.

Statistical Analysis

The Student's *t*-test (two-sided, unequal variance) was used to test for statistical significance in PI between control and treatment groups using Microsoft Excel version 5.0. A P value of 0.05 was judged to be statistically significant.

Bromodeoxyuridine (BrdU) Staining and Evaluation

Tissue Collection for Cell Proliferation

Seven days before the week 52 interim sacrifice, osmotic pumps containing 20 mg/ml BrdU were surgically implanted in five animals per sex per group in groups 1 and 5 for hepatocellular proliferation. A section of the liver and duodenum from each of 5 rats per group (groups 1 and 5 only) was taken at necropsy and embedded to paraffin block by Covance per protocol specifications. Tissue blocks were shipped to PAI for sectioning and staining. From each block, a slide was prepared for H&E evaluation and immunohistochemical detection of BrdU, an exogenous marker of cell proliferation.

Immunohistochemistry for Cell Proliferation

Sections of paraffin-embedded tissues were cut at 5 µm and placed on positively charged slides (Superfrost Plus, Fisher Scientific, Pittsburgh, PA) to ensure adhesion during processing for BrdU. Standard immunohistochemical methods were used to stain tissues for BrdU [PAI's Standard Operating Procedure for Immunohistochemical Staining (SOP #707)]. Briefly, tissue sections were incubated with a monoclonal antibody to BrdU (Becton Dickenson, lot #81604;

PAI No. A2089) and reagents required for the avidin-biotin peroxidase (ABC Kit; Vector, lot #PK-6100; PAI No. K351) method for the detection of the antigen-antibody complex. BrdU incorporation into cells in S phase of the cell cycle was localized by the chromagen 3,3'-diaminobenzidine (DAB; Sigma Chemical Co., lot #108H8210). Tissue sections were counterstained with hematoxylin.

Cell Proliferation Measurements

The percentage of BrdU-labeled cells (labeling index, LI) was determined by scoring at least 2000 hepatocytes in 10 fields of liver. Slides were first perused at low magnification (100X) to judge quality of staining, processing and sectioning, pattern of cell labeling (e.g., centrilobular or panlobular, extrahepatocellular proliferation, such as Kupffer cells, bile duct epithelium, endothelium), and histomorphologic changes. The latter was further assessed by evaluating the H&E slide for each animal evaluated for cell proliferation. Cell proliferation was then quantified at higher magnification (200X) as described above.

A negative control slide was included in the staining run and consisted of study tissue from animal #C92534 that was not incubated with the primary antibody.

Statistical Analysis

The Student's *t*-test (two-sided, unequal variance) was used to test for statistical significance in LI between control and treatment groups using Microsoft Excel version 5.0. A P value of 0.05 was judged to be statistically significant.

RESULTS

PCNA Cell Proliferation

Individual animal and group mean PCNA cell proliferation data are presented in Section II (Tables 1-4) and graphically in Section III (Figures 1 and 2). The negative control tissue was judged to be free from background staining. At 4 and 14 weeks on study, the percentage of proliferating hepatocytes (PI) in treated animals did not differ significantly from control animals for either sex.

BrdU Cell Proliferation

Individual animal and group mean BrdU cell proliferation data are presented in Section II (Table 5) and graphically in Section III (Figure 3). The negative control tissue was judged to be free from background staining. The percentage of labeled hepatocytes (LI) in treated animal groups did not differ significantly from control animals for either sex at 52 weeks on study.

Histopathology

Sections from the same tissue blocks used for preparation of PCNA- and BrdU-stained slides were stained with hematoxylin and eosin (H&E) for histopathologic evaluation to facilitate the

interpretation of the immunostained slides. Individual animal findings and group summaries are presented in Appendix I.

The results showed that no significant changes were observed in the liver from male and female rats, which would alter the interpretation of the PCNA or BrdU staining in this study.

DISCUSSION

In the present study, cell proliferation was measured by PCNA immunohistochemistry within the liver of male and female rats from control (Group 1), low dose (Group 2), mid dose (Group 3), mid-high dose (Group 4), and high dose (Group 5) groups after 4 and 14 weeks on study, and by BrdU immunohistochemistry in the liver from control (Group 1) and high dose (Group 5) male and female rats after 52 weeks on study. The decision to use BrdU labeling to detect proliferating cells at 52 weeks was based on the increased sensitivity of continuous labeling with BrdU compared to PCNA in detecting a proliferative response in the liver of rats. In this case, BrdU was administered via osmotic pump continuously for 7 days.

A statistically significant increase in cell proliferation, as determined by the PCNA proliferating index (PI) at 4 and 14 weeks, or by the BrdU labeling index at 52 weeks, was not observed in the liver of male or female rats. Although statistical analysis did not reveal a significant cell proliferative response to the test material, biological significance was evident in individual animals. Biological significance for an individual animal is defined as a doubling in PI or LI over controls and greater than the highest control value. Thus, the data are presented in terms of severity (fold increase over controls) and incidence (number of animals showing biological significance). As seen in Text Table 1, biologically significant cell proliferation was evident in 2/5 male rats at the high dose after 4 weeks on study and in 1/5 male rats at the mid-high dose and mid dose after 4 weeks on study. This apparent and minimal proliferative response seen in male rats at 4 weeks was less than the control PI at 14 weeks, and was not sustained as evidenced by the lack of a response at week 14. Furthermore, none of the animals exhibited a proliferative response at 52 weeks. Therefore, the proliferative responses seen in these individual male animals was a possible mild response evident only at 4 weeks.

Text Table 1. Biologically Significant Cell Proliferation in Liver of Male Rats

Group	Week 4		Week 14		Week 52	
	Severity[1]	Incidence[2]	Severity[1]	Incidence[2]	Severity[1]	Incidence[2]
Low dose	<1	0/5	<1	0/5	-	-
Mid dose	1.6	1/5	<1	0/5	-	-
Mid-high dose	1.0	1/5	<1	0/5	-	-
High dose	1.5	2/5	<1	0/5	<1	0/4

[1]Fold increase over controls
[2]Number of animals with a PI or LI double the mean control value and greater than the highest control animal

In contrast to male rats, biologically significant cell proliferation was evident in female rats at the mid-high dose (2/5 rats) and at the high dose (2/5 rats) after 4 weeks, and at the low dose (2/5 rats) and mid dose (1/5 rats) after 14 weeks on study, as seen in Text Table 2. The degree of the proliferative response observed in females was greater than that seen in the males. The proliferative response observed at week 4 was not sustained after 14 weeks, nor was a proliferative response observed at 52 weeks. Based on the severity and incidence of the proliferative response seen in the high dose females, and the dose response relationship seen at 4 weeks, the test material is judged to induce a transient proliferative response in the liver of female rats at the high dose.

Text Table 2. Biologically Significant Cell Proliferation in Liver of Female Rats

Group	Week 4		Week 14		Week 52	
	Severity[1]	Incidence[2]	Severity[1]	Incidence[2]	Severity[1]	Incidence[2]
Low dose	1.0	0/5	2.6	2/5	-	-
Mid dose	1.1	0/5	1.2	1/5	-	-
Mid-high dose	1.8	2/5	<1	0/5	-	-
High dose	3.5	2/5	<1	0/5	<1	0/5

[1]Fold increase over controls
[2]Number of animals with a PI or LI double the mean control value and greater than the highest control animal

Interestingly, a rare pattern of PCNA-labeling was observed in high dose female rats at week 14, which was not seen in any other groups, nor at the earlier time point. The staining was characterized by a granular cytoplasmic staining pattern localized to the hepatocytes around central veins of the liver. The significance of this type of labeling pattern is not known; however, it has been speculated that it may represent mitochondrial DNA synthesis (unpublished observation). Recently, it has been shown that PCNA can cross-react with peroxisomal multifunctional protein (Mayer, et al., 1998). Thus, it is possible that the centrilobular staining pattern observed in the high dose animals may be associated with peroxisomes.

The cell proliferation rates in the week 14 male rats were all higher than those in the week 4 male rats. In the female rats, cell proliferation rates at week 14 were higher than at week 4 in the control, low dose and mid dose groups, but not in the mid-high or high dose groups. The reason for the consistently higher cell proliferation rates in the week 14 animals is not known. However, all slides from the 4 and 14 week time points were stained together, so variation in staining between runs can be ruled out. One possibility is that the tissues were handled differently in terms of fixation and processing, which may have affected the staining. Despite this difference, comparisons can be made between each treatment group and the control group for a specific time point.

SUMMARY

The cell proliferation seen in the liver of male rats at 4 weeks was not dose-related, was minimal in severity (high dose was less than two-fold greater than controls), occurred in two of five

animals in the high dose group, and was transient in nature (i.e., was not sustained at 14 weeks). In female rats, cell proliferation in the liver was dose-related at week 4 but not at week 14, greater in severity compared to male rats (greater than two-fold at the high dose), and occurred in two of five animals in both the high and mid-high dose groups. Based on these findings, cell proliferation effects seen at 4 weeks in the rats were considered to be related to test material. At 52 weeks, there was no evidence of hepatocellular proliferation in male or female rats at the high dose.

Cell Proliferation Report

104-Week Dietary Chronic Toxicity and Carcinogenicity Study With Perfluorooctane Sulfonic Acid Potassium Salt (PFOS; T-6295) in Rats

Covance Study No.: 6329-183

QUALITY ASSURANCE STATEMENT

This cell proliferation project has been inspected and audited by the PAI Quality Assurance Unit (QAU) as required by the Good Laboratory Practice (GLP) regulations promulgated by the U. S. Environmental Protection Agency (EPA-TSCA). The cell proliferation report is an accurate reflection of the recorded data. The following table is a record of the inspections/audits performed and reported by the QAU.

Date of Inspection	Phase Inspected	Date Findings Report to PAI Management/ Project Manager/Pathologist

Final Report Amendment

Covance Study Number:	6329-183
PAI Study Number:	EM 01.37
Study Title:	Transmission Electron Microscopy Evaluation of Liver Tissue in Rats. 104-Week Dietary Chronic Toxicity and Carcinogenicity study with Perfluorooctane sulfonic acid potassium salt (PFOS;T-6295) in rats
Date of Final Report:	October 10, 2001
Amendment:	Change Covance Study number from 6239-183 to the correct Study number of 6329-183 on the cover page and all the "Transmission Electron Micrograph Interpretation" forms found in Section II.
Reason for amendment:	Typographical error

Approvals:

SECTION I

PATHOLOGY NARRATIVE

Summary

Ten CrL:CD® (SD) IGS BR rats (five males and five females) were treated for 104 weeks with 20.0ppm (PFOS; T-6295). Ten other rats of similar strain (five males and five females) were used as controls. Liver samples were obtained from each of the 20 rats during necropsy at terminal sacrifice for examination by transmission electron microscopy (TEM). Liver samples were assessed for ultrastructural changes that may be related to chronic toxicity of the test material when administered in the diet. Electron microscopic evaluation identified mild to moderate changes related to treatment. Mild to moderate smooth endoplasmic reticulum hyperplasia and minimal to mild hepatocellular hypertrophy were the prominent features found to be different between the high dose group and control animals. Other changes included a slight increase in the amount of glycogen in treated animals compared with controls.

Procedure

The objective of this study was to examine ultrastructurally samples of liver from 10 rats treated orally for 104-weeks with PFOS; T-6295. This study is part of a larger chronic toxicity study of PFOS; T-6295. This portion of the study included 10 treated rats (5 males and 5 females) and 10 control rats (5 males and 5 females). Treated rats were orally dosed daily for at least 104 weeks with 20ppm of T-6295. The control rats were given the basal diet only. Terminal necropsies were performed on all 20 rats. Multiple tissues including liver were collected and preserved in 10% neutral-buffered formalin according to the study protocol. Additionally, samples of liver from each animal were thin-sliced, placed in 2% paraformaldehyde/2.5% glutaraldehyde in 0.1M phosphate buffer then subsequently processed and embedded in epoxy blocks for examination by TEM. Thin sections (approximately 90nm) from the epoxy blocks were cut, mounted on 200-mesh copper grids, stained with 5% methanolic uranyl acetate, and Reynold's lead citrate, then examined on a Zeiss EM10C or a Zeiss 900 transmission electron microscope. Both centrilobular and periportal hepatocytes were examined. Representative ultrastructural photomicrographs from each liver sample were taken and significant features were described and recorded for each micrograph, animal, and group. The descriptive features of each rat were recorded on a transmission electron micrograph interpretation form. The number of peroxisomes per hepatocyte was manually counted then averaged for each animal. The average number of peroxisomes per group was tabulated.

Results

Micrograph interpretations for each rat can be found in section II. Representative micrographs of specific features are shown in section III as report figures. All remaining electron micrographs are separately attached to this report grouped according to rat number.

TEM evaluation

A total of 113 micrographs were evaluated. Fifty-four (54) micrographs represented the control group while fifty-nine (59) micrographs represented the high-dose treated group. Ultrastructural findings for each group are summarized in Table 1. There was a minimal to mild increase in the size of hepatocytes in the treated group. Similarly, a mild to moderate increase in smooth endoplasmic reticulum (SER) was also noted. The increase in the size of most hepatocytes was generally due to the increase in SER. SER is invariably affected during some types of hepatic toxicity, mostly toxicities that induce

hepatic microsomal enzymes and lipid peroxidation (Cheville, 1994). Similarly, the increase in SER is regarded as an adaptive response by animals as a means to handle drug toxicities (Ghadially, 1997). Based on personal communication with the study pathologist, liver weights were increased and hepatocellular hypertrophy was evident in high dose animals, which is consistent with ultrastructural findings of an increase in SER (Ghadially, 1997).

Other minor features between treated and control groups were slight increases in glycogen and lipid. Both glycogen and lipid accumulations are considered a non-deleterious adaptive change and not overtly related to treatment. An incidental finding of large granular cell leukemia was seen in rat C92775, a high dose group male. All control animals were considered normal. Although a small number of control rats had a mild increase in SER, the increase in SER in hepatocytes of treated animals was much more prominent compared with the amount in hepatocytes of control animals.

Table 2 summarizes the quantitation of peroxisomes for each group. Often, an increase in the number of peroxisomes indicates an alteration in liver cell physiology. However, in this study, the average number of peroxisomes was not obviously different between treated and untreated animals.

Table 1 Ultrastructural findings per animal

Animal no	Group[1]/Sex[2]	Comments
C92505	1/M	Normal hepatocytes.
C92510	1/M	Normal hepatocytes.
C92513	1/M	Normal hepatocytes.
C92514	1/M	Normal hepatocytes.
C92518	1/M	Normal hepatocytes.
C92757	5/M	SER is increased in 5/5 hepatocytes. One hepatocyte had scattered glycogen while another hepatocyte is hypertrophic.
C92762	5/M	Mild Hepatocellular hypertrophy (2/5), increased SER (5/6). Two hepatocytes had some accumulation of glycogen.
C92775	5/M	Circulating lymphocytes are consistent with a diagnosis of large granular cell leukemia. SER is noticeably increased in 6/6 hepatocytes. Mild hepatocellular hypertrophy (1/6).
C92786	5/M	Hepatocytes (5/5) had early autolytic changes most likely due to fixation artifact; therefore, interpretation was limited.
C92791	5/M	A moderate to marked increase in SER. Glycogen is observed in 4/5.
C92868	1/F	Normal hepatocytes. One hepatocyte had abundant SER while two others have mild SER accumulation.
C92871	1/F	Normal hepatocytes.
C92874	1/F	Normal hepatocytes. One hepatocyte had a small amount of SER.
C92896	1/F	Normal hepatocytes. SER is minimally increased.
C92897	1/F	Normal hepatocytes.
C93113	5/F	Mild hepatocellular hypertrophy (2/6). SER is increased in 3/6 hepatocytes while lipid is prominent in 2/6 hepatocytes.
C93124	5/F	Mitochondria appear slightly larger in 4/6 hepatocytes.
C93125	5/F	Hepatocellular hypertrophy (4/6). SER is increased in 5/6 hepatocytes. One hepatocytes has scattered deposits of glycogen.
C93135	5/F	Mild hepatocellular hypertrophy (3/5). The amount of SER is increased in 5/5 hepatocytes while 4/5 hepatocytes have lipid accumulation. One hepatocyte also has scattered glycogen.
C93149	5/F	Hepatocellular hypertrophy (4/6). SER is increased in 6/6 hepatocytes. Lipid is present in 4/6 while one hepatocyte has lipofuscin granules.

[1]1=Control, 5=High dose group; [2]M=male, F=female; [3]ratio of abnormal hepatocytes per total number of hepatocytes described.

Table 2 Quantitation of Peroxisomes per rat[1]

Control Group				Treated Group			
Animal #	**Male**	**Animal #**	**Female**	**Animal #**	**Male**	**Animal #**	**Female**
C92505	21.8	C92868	16.6	C92757	20.2	C93113	27.5
C92510	21.2	C92871	15.6	C92762	18.0	C93125	18.3
C92513	16.5	C92874	16.4	C92775	13.0	C93135	20.0
C92514	16.0	C92896	22.8	C92786	13.8	C93149	16.3
C92518	32.2	C92897	16.2	C92791	19.5	C93124	26.8
Mean = 21.6		**Mean = 17.5**		**Mean = 16.9**		**Mean = 21.8**	

[1]The average number of hepatocytes counted per rat was 4.

Conclusion

Transmission electron microscopy evaluation was done on liver samples from rats treated orally with 20.0ppm PFOS;T-6295 for a total of at least 104 weeks. Treatment related ultrastructural changes included minimal to mild hepatocellular hypertrophy and a mild to moderate increase in SER.

SECTION II

TRANSMISSION ELECTRON MICROGRAPH INTERPRETATIONS

TRANSMISSION ELECTRON MICROGRAPH INTERPRETATION

Study No.: 6329-183 EM 01.37

Species/Strain: Cr:CD® (SD) IGS BR

Animal No.: C92505

Tissue: Liver-Centrilobular

Treatment Group: 1 (Control)

Block No(s).: C92505-2A

Sex: Male

Photo/Negative No(s).:L6116-L6121

Significant Lesions (check one): _____ Yes __X__ No

Interpreting Pathologist (signature and date): March 19, 2001

Features:**L6116.** Liver. Hepatocyte. 7,920X. An oval shaped hepatocyte is located horizontally in the center of the micrograph. The nucleus is round with finely granular chromatin. Within the cytosol, there are numerous lipid droplets, mitochondria, and both RER and SER. Nineteen (19) peroxisomes are counted. The micrograph also contains multiple small elongated fissures (tissue artifact).
L6117. Liver. Hepatocyte. 7,920X. The hepatocyte is the exact same cell as in micrograph labeled **L6116**. Peroxisomes not counted.
L6118. Liver. Hepatocyte. 7,920X. A somewhat rounded hepatocyte is located in the center of the micrograph. The nucleus of this hepatocyte is rounded with two nucleoli, one marginating along the periphery of the nuclear membrane. Within the cytosol, there are numerous mitochondria, RER, and a number of large lipid vacuoles. A few small lysosomes are also found. Seventeen (17) peroxisomes are counted.
L6119. Liver. Hepatocyte. 7,530X. In the center of the micrograph is a hepatocyte that has two nuclei. Both nuclei are approximately the same size and shape. Both have a centrally located nucleolus. Within the cytosol of this large somewhat cuboidal cell are numerous mitochondria, RER, and lysosomes. Along the bottom left hand portion of the cell, there is a myelin figure observed. Thirty (30) peroxisomes are counted.
L6120. Liver. Hepatocyte. 10,200X. An oval centrally located hepatocyte is described. There is a large, round, somewhat eccentric nucleus with a single centrally located nucleolus. Within the cytosol, there are numerous round same-sized mitochondria, abundant RER, and a few randomly scattered lysosomes. Twenty-one (21) peroxisomes are counted.
L6121. Liver. Hepatocyte. 14,400X. A high magnification of the cytoplasm of a hepatocyte. The nucleus of the hepatocyte is found at the bottom of the micrograph. Within the cytosol, there are a number of mitochondria with normal lamellar cristae. In addition to the mitochondria, there is an abundance of RER, and randomly scattered lysosomes. A bile canaliculus is observed separating this hepatocyte from another hepatocyte at the upper right hand top of the micrograph. Peroxisomes not counted.

Conclusions: Normal hepatocytes. Two hepatocytes had a few lipid droplets. Peroxisome average is 21.8 per hepatocyte.

TRANSMISSION ELECTRON MICROGRAPH INTERPRETATION

Study No.: 6329-183 EM 01.37

Species/Strain: Cr:CD® (SD) IGS BR

Animal No.: C92510

Tissue: Liver-Periportal

Treatment Group: 1 (Control)

Block No(s).: C92510 2A

Sex: Male

Photo/Negative No(s).:L6183-L6187

Significant Lesions (check one): _____ Yes __X__ No

Interpreting Pathologist (signature and date): [signature] March 19, 2001

Features: **L6183**. Liver. Hepatocyte. 7,530X. In the center of the micrograph is a binucleated hepatocyte. The nuclei of this hepatocyte are similar in size and both are round. Within the cytosol, there are a number of similar sized mitochondria. RER is also observed. The cell membrane is easily delineated from the adjacent hepatocytes. Twenty (20) peroxisomes are counted. A bile canaliculus is found along the left hand edge of the micrograph between the central hepatocyte and the adjacent hepatocyte on that side.
L6184. Liver. Hepatocyte. 7,920X. A vertically centered hepatocyte is found in this micrograph. Along the top right hand corner, there are a few clumped erythrocytes. The central hepatocyte has a distinctly rounded nucleus having finely granular chromating. There are numerous mitochondria, RER, SER, and a few lipid droplets in the cytoplasm of this cell. Twenty-two (22) peroxisomes are counted.
L6185. Liver. Hepatocyte. 10,200X. A somewhat cuboidal hepatocyte is located in the center of the micrograph. The nucleus of this cell is small and round. The cytoplasm is abundant. Numerous mitochondria, RER, and lesser amount of SER are observed in the cytoplasm. Twenty-five (25) peroxisomes are counted. Erythrocytes are found along the top right hand edge of the micrograph.
L6186. Liver. Hepatocyte. 10,200X. A centrally located hepatocyte is noted in this micrograph. The nucleus is "bean" shaped due to a large lipid vacuole compressing along one side. There is another smaller lipid vacuole also observed in the cytoplasm. In addition to the lipid, there are numerous mitochondria, and RER in the cytoplasm. Eighteen (18) peroxisomes are counted.
L6187. Liver. Hepatocyte. 10,200X. A large magnification of a single hepatocyte. The nucleus is somewhat rounded with irregular indentation of the nuclear membrane. A single eccentric nucleolus is also observed. The cytoplasm contains a zonal cluster of mitochondria along the left hand edge and an expanded region of SER along the right hand edge of the cell. A small amount of RER is scattered randomly throughout the cell. Twenty-one (21) peroxisomes are counted.

Conclusions: Normal hepatocytes. Two hepatocytes had small lipid droplets while another had an expanded region of SER. Peroxisome average is 21.2 per hepatocyte.

Sex: Male

Photo/Negative No(s).: Z21345-Z21349

Significant Lesions (check one): _____ Yes X No

Interpreting Pathologist (signature and date): [signature] March 19, 2001

Features: **Z21345.** Liver. Hepatocyte. 15,700X. Approximately 90% of a single hepatocyte is observed in this micrograph. The nucleus is round with marginating chromatin. Within the cytosol, there are a number of mitochondria, SER, and RER. A few lipid vacuoles are also observed. Seventeen (17) peroxisomes are counted. Along the left hand edge of the micrograph is a bile canaliculus.
Z21346. Liver. Hepatocyte. 10,900X. In the center of the micrograph, there is a hepatocyte with a large rounded nucleus and a smaller nucleus along the right hand side of the micrograph. Within the larger nucleus, there is an eccentrically located single nucleolus. The cytosol contains a slightly decreased number of mitochondria, abundant RER, and a few randomly scattered lysosomes and lipid vacuoles. Nineteen (19) peroxisomes are counted.
Z21347. Liver. Hepatocyte. 10,900X. Approximately 90% of a single hepatocyte is found located in the center of the micrograph. This hepatocyte has an eccentrically located nucleus with one dense nucleolus. Within the cytosol, there is a cluster of lipid vacuoles along the right side of the cell. In addition to the lipid, there are a number of mitochondria, abundant RER, and a small amount of SER. Twenty-one (21) peroxisomes are counted.
Z21348. Liver. Hepatocyte. 15,700X. Approximately 90% of a single hepatocyte is observed in this micrograph. The nucleus is rounded and eccentrically located in the cell. There are five lipid droplets in the cytosol surrounded by mitochondria and RER. Abundant glycogen is also noted in the cytoplasm. Nine (9) peroxisomes are counted. A bile canaliculus is located at the top of the micrograph.
Z21349. Liver. Hepatocyte. 36,200X. A high magnification of the cytoplasm of a hepatocyte. Within the cytoplasm, there are a number of normal mitochondria. Scattered between the mitochondria are RER and small glycogen rosettes. Peroxisomes not counted.

Conclusions: Normal hepatocytes. A few lipid droplets were found in 4/5 hepatocytes, and scattered glycogen (2/5 hepatocytes) was also observed. Peroxisome average is 16.5 per hepatocyte.

TRANSMISSION ELECTRON MICROGRAPH INTERPRETATION

Study No.: 6329-183 EM 01.37

Species/Strain: Cr:CD® (SD) IGS BR

Animal No.: C92514

Tissue: Liver-Periportal

Treatment Group: 1 (Control)

Block No(s).: C92514-2A

Sex: Male

Photo/Negative No(s).: Z21350-Z21354

Significant Lesions (check one): _____ Yes X No

Interpreting Pathologist (signature and date): [signature] March 19, 2001

Features: **Z21350.** Liver. Hepatocyte. 10,900X. A centrally located cuboidal hepatocyte is observed in this micrograph. The nucleus is round with a marginating nucleolus. The cytosol is filled with similar-sized mitochondria, RER, and a few lysosomes. Seventeen (17) peroxisomes are counted. Along the top left hand corner, there is a portion of a sinusoid. Small bile canaliculi are found between the central hepatocyte and the adjoining hepatocytes on both sides.

Z21351. Liver. Hepatocyte. 10,900X. A somewhat rounded hepatocyte is noted in the center of the micrograph. This hepatocyte contains a centrally located nucleus with a central nucleolus. The cytosol contains numerous mitochondria, RER, and a few lipid vacuoles. Eleven (11) peroxisomes are counted. Bordering the hepatocyte on the bottom and left hand side are bile canaliculi.

Z21352. Liver. Hepatocyte. 10,900X. Approximately 60% of a hepatocyte is observed in this micrograph. The nucleus is eccentrically located, round, with finely granular chromatin. There are numerous mitochondria and abundant RER in the cytoplasm. Peroxisomes not counted.

Z21353. Liver. Hepatocyte. 10,900X. A cuboidal hepatocyte is located in the center of the micrograph. The nucleus is round with a large nucleolus. The cytosol contains abundant RER, less SER, and numerous mitochondria. Twenty (20) peroxisomes are counted. A bile canaliculus is found along the lower half of the micrograph bordering the hepatocyte.

Z21354. Liver. Hepatocyte. 36,200X. A high magnification of mitochondria in the cytoplasm of a single hepatocyte. The mitochondria are normal with well-developed cristae. There is also abundant RER observed as well. Peroxisomes not counted.

Conclusions: Normal hepatocytes. Peroxisome average is 16.0 per hepatocyte.

Significant Lesions (check one): _____ Yes X No

Interpreting Pathologist (signature and date): [signature] March 19, 2001

Features: **Z21355.** Liver. Hepatocyte. 10,900X. Approximately 95% of a hepatocyte is observed in the center of the micrograph. The hepatocyte contains an eccentrically located nucleus that has three rounded edges and a flat edge. Within the nucleus, there is a centrally located dense nucleolus. The cytosol contains numerous mitochondria, abundant RER, and less SER. Thirty-one (31) peroxisomes are counted.

L6203. Liver. Hepatocyte. 7,920X. An oval hepatocyte is found in the center of the micrograph. An eccentrically located nucleus is somewhat oval as well. The chromatin is finely granular. Within the cytosol are numerous small similar-sized mitochondria and abundant RER. A few small lysosomes are observed as well. Thirty-four (34) peroxisomes are counted. Along the bottom edge of the micrograph, there is a portion of a perisinusoidal fat storing cell (Ito cell).

L6204. Liver. Hepatocyte. 7,920X. In the center of the micrograph, there is a somewhat polygonal shaped hepatocyte. This hepatocyte is bordered by portions of other hepatocytes along the bottom and top edge of the micrograph. The nucleus is small and cuboidal in shape. There is an abundance of cytoplasm filled with a number of small mitochondria, SER, RER, and a few small lysosomes. Thirty-three (33) peroxisomes are counted.

L6205. Liver. Hepatocyte. 7,920X. An oval shaped hepatocyte is observed in the upper central region of the micrograph. The hepatocyte contains a large rounded nucleus having finely stippled chromatin and small rounded pale nucleolus. The cytosol contains numerous mitochondria, SER, and some RER. Thirty-six (36) peroxisomes are counted. Below this hepatocyte, there are two other hepatocytes, one filled with six large lysosomes. Another perisinusoidal fat storing cell (Ito cell) is observed along the left hand margin of the micrograph.

L6206. Liver. Hepatocyte. 10,200X. A higher magnification of a single hepatocyte. Approximately 97% of the hepatocyte is observed. The nucleus is large, rounded, with a somewhat centrally located nucleolus. The cytosol contains numerous mitochondria, RER, SER, and a few randomly scattered lysosomes. Twenty-seven (27) peroxisomes are counted. There is a small bile canaliculus adjacent to the hepatocyte located on the upper left hand edge of the micrograph.

L6207. Liver. Hepatocyte. 28,350X. High magnification of the cytoplasm of a hepatocyte. Within this micrograph, there are a number of mitochondria, RER, and SER. Peroxisomes not counted.

Conclusions: Normal hepatocytes. Two hepatocytes had a small amount of SER. Peroxisome average is 32.2 per hepatocyte.

Sex: Male

Photo/Negative No(s).:L6122-L6126 &L6200

Significant Lesions (check one): X Yes_____ No

Interpreting Pathologist (signature and date): March 20, 2001

Features:**L6122.** Liver. Hepatocyte. 7,530X. A somewhat rounded hepatocyte is found in the center of the micrograph. The nucleus of this cell is small. The cytoplasm contains mitochondria that are dispersed between patches of SER and less RER. Glycogen particles are scattered throughout the cell. Lipid vacuoles, some with myelin figures and a few small lysosomes are also observed. Thirty-two (32) peroxisomes are counted. Thin to somewhat dilated sinusoids separate this hepatocyte from portions of other hepatocytes. Similar to the central hepatocyte, lysosomes, glycogen, SER, RER, and mitochondria fill the cytoplasm of the surrounding hepatocytes.

L6123. Liver. Hepatocyte. 7,530X. In the lower center half of the micrograph somewhat located on the right side is a large globoid hepatocyte. This hepatocyte is bordered by three other hepatocytes. One hepatocyte along the lower left corner contains a number of lipid vacuoles. The central hepatocyte has a small distinctly round nucleus. The cytosol is filled with widely spaced mitochondria and RER due to abundant SER. A few small lysosomes and lipid vacuoles are also observed. Twenty-two (22) peroxisomes are counted.

L6124. Liver. Hepatocyte. 7,530X. The centrally located hepatocyte is oval with an eccentrically located round nucleus. The cytoplasm contains numerous mitochondria, SER, RER, and two large lipid vacuoles. The cell is surrounded on three sides by dilated sinusoids containing erythrocytes. Twenty (20) peroxisomes are counted. Other hepatocytes on this micrograph have similar characteristics as the hepatocyte described. The micrograph is pale and somewhat distorted due to chatter lines.

L6125. Liver. Hepatocyte. 7,920X. In the center of the micrograph, there is a large hepatocyte with no nucleus. A cluster of lipid vacuoles are found along the right side of the cell while mitochondria and SER are located in the left hand portion of the cytoplasm. Fifteen (15) peroxisomes are counted. A number of these peroxisomes are large and prominent. Surrounding this cell, on three sides, is a large dilated sinusoid containing erythrocytes.

L6126. Liver. Hepatocyte. 4,990X. In the center of the micrograph is an oval hepatocyte with two small portions of a nucleus. The cytoplasm is distended due to an increase in SER, numerous mitochondria, and randomly scattered RER. A few moderate sized lipid vacuoles and small lysosomes are also observed. Nineteen (19) peroxisomes are counted. Similar to hepatocyte in micrograph L6125, the hepatocyte is surrounded by dilated sinusoids that contain erythrocytes. In the top portion of the micrograph, there is a perisinusoidal fat storing cell (Ito cell) within the sinusoid above the central hepatocyte.

L6200. Liver. Hepatocyte. 7,920X. A large vertically centered oval hepatocyte is observed in this micrograph. Surrounding this hepatocytes are erythrocytes and a finely reticulated material within sinusoids. The cell has a large round nucleus with a marginating nucleolus. The cytosol of this hepatocyte is filled with SER, RER, mitochondria, and randomly scattered variable-sized lipid vacuoles. Thirteen (13) peroxisomes are counted.

Conclusions: SER is increased in 5/5 hepatocytes. One hepatocyte had scattered glycogen while another hepatocyte is hypertrophic. Peroxisome average is 20.2 per hepatocyte.

Significant Lesions (check one): X Yes_____ No

Interpreting Pathologist (signature and date): [signature] March 20, 2001

Features: **L6127.** Liver. Hepatocyte. 7,530X. A vertically centered oval hepatocyte is observed in this micrograph. Along the left side of the hepatocyte, there is a dilated sinusoid containing two erythrocytes. To the right hand edge of the micrograph, there is a small portion of a dark staining hepatocyte. The central hepatocyte does not have a nucleus (sectioning artifact). The cytoplasm is filled with mitochondria, patches of SER, and some RER. A few lysosomes are also observed. Due to the dark staining of the micrograph, peroxisomes are not counted.

L6128. Liver. Hepatocyte. 7,530X. A pyramidal-shaped hepatocyte with a large centrally located round nucleus is located in the middle of the micrograph. The cytosol of this hepatocyte is filled with patches of SER, RER, and numerous mitochondria. Randomly scattered lipid vacuoles and a small amount of glycogen are also observed in the cytoplasm. Ten (10) peroxisomes are counted. Alongside on the left is a sinusoid containing erythrocytes. In addition to the red blood cells, there is a large plasma cell located in the upper left hand corner.

L6129. Liver. Hepatocyte. 12,100X. High magnification of the cytoplasm of a hepatocyte. Within the cytoplasm, there are a number of similar sized mitochondria, RER, and some SER. A few randomly scattered glycogen particles and two lipid droplets are also observed. Peroxisomes not counted.

L6130. Liver. Hepatocyte. 7,530X. A round hepatocyte is found in the center of the micrograph. The nucleus is also round and centrally located within the cell. Randomly scattered are numerous mitochondria, RER, and a cluster of lipid vacuoles located in the lower portion of the cytoplasm. Surrounding lipid vacuoles is a dense accumulation of glycogen. Thirty-one (31) peroxisomes are counted. Surrounding this hepatocyte are other hepatocytes within similar characteristics. A sinusoid containing erythrocytes is noted on the lower left hand portion of the micrograph.

L6131. Liver. Hepatocyte. 7,920X. A slightly larger polygonal hepatocyte is found in the center of the micrograph. In the upper right hand corner there is a clump of erythrocytes in a sinusoid. The central hepatocyte contains an eccentrically located somewhat small, rounded nucleus with a single nucleolus. The cytoplasm contains numerous mitochondria, some RER, and a slight increase in SER. A few lipid vacuoles are also observed. Twenty-one (21) peroxisomes are counted. Below this hepatocyte, there are three other hepatocytes with similar characteristics.

L6201. Liver. Hepatocyte. 7,920X. A large cuboidal-shaped hepatocyte is found in the center of the micrograph. The nucleus is eccentrically located and contains a single marginating nucleolus. The cytoplasm is distended with a large increase in SER and less RER. A moderate number of mitochondria and a few lipid droplets are also observed in the cytoplasm. Ten (10) peroxisomes are counted. In the upper right hand corner, there is a dilated sinusoid containing one erythrocyte in a finely granular matrix.

Conclusions: Mild hepatocellular hypertrophy (2/5 hepatocytes), increased SER (5/6). Two hepatocytes had some accumulation of glycogen. Peroxisome average is 18 per hepatocyte.

Significant Lesions (check one): X Yes _____ No

Interpreting Pathologist (signature and date): [signature] March 20, 2001

Features: **L6132.** Liver. Hepatocyte. 10,200X. Located to the left hand side of the micrograph is a polygonal-shaped hepatocyte. This hepatocyte contains a centrally located nucleus with a large round nucleolus. There are a number of small round mitochondria in the cytoplasm, separated by SER and RER. Fifteen (15) peroxisomes are counted. Below this hepatocyte to the lower left of the micrograph is a sinusoid containing a number of erythrocytes and four large lymphocytes.
L6133. Liver. Hepatocyte. 10,200X. Approximately 50% of a hepatocyte is observed along the top of the micrograph. This hepatocyte has a large round nucleus with finely stippled chromatin. The cytosol contains RER, mitochondria, and SER. Peroxisomes not counted. Below this hepatocyte is a sinusoid with a finely granular matrix containing a large lymphocyte and an erythrocyte. Chatter lines along the bottom half of the micrograph are artifact.
L6134. *Liver. Hepatocyte. 7,920X. A rounded hepatocyte is found in the center of the micrograph.* This cell has a large distinctly rounded nucleus with one round nucleolus. The cytoplasm of this cell contains abundant SER, RER, and numerous mitochondria. Fifteen (15) peroxisomes are counted. Portions of other hepatocytes surround the central hepatocyte. These cells have similar cytoplasmic characteristics. Along the bottom of the micrograph, a sinusoid contains two erythrocytes and a lymphocyte.
L6135. Liver. Hepatocyte. 7,920X. The micrograph is somewhat distorted due to chatter lines. The centrally located hepatocyte is pyramidal in shape with a large rounded nucleus. The cytosol contains a number of mitochondria that are separated by RER and a few small patches of SER. Six (6) peroxisomes are counted. Another hepatocyte along the lower left hand margin of the micrograph contains a few small lysosomes along with SER, RER and mitochondria. The nucleus of this cell is somewhat rounded. In the upper right hand corner, a few clumped erythrocytes are observed along with a small tear in the tissue (artifact).
L6136. Liver. Hepatocyte. 7,920X. Portions of two hepatocytes are located in the top half of the micrograph. Approximately 90% of the hepatocyte on the left is visible. The nucleus of this cell is large and distinctly round. A somewhat eccentrically located nucleolus is found in the nucleus. Abundant mitochondria, RER and some SER are present in the cytoplasm. Fifteen (15) peroxisomes are counted. On the bottom of the micrograph, there is a large sinusoid containing a circulating a lymphocyte and a few erythrocytes.
L6137. Liver. Hepatocyte. 10,200X. A large hepatocyte is observed in this micrograph. A small portion of a sinusoid with clumped erythrocytes is observed in the upper portion of the micrograph. The nucleus of the endothelial lining of the sinusoid is noted just above the upper left of the central hepatocyte. The hepatocyte contains a large somewhat rounded nucleus with a marginating nucleolus and finely granular chromatin. The cytosol contains numerous mitochondria, RER, and large patches of SER. A few randomly scattered dense lysosomes are also observed. Fourteen (14) peroxisomes are counted.

Conclusions: Circulating lymphocytes are most consistent with a diagnosis of large granular cell leukemia. SER is noticeably increased in 6/6 hepatocytes. Mild hepatocellular hypertrophy (1/6 hepatocytes). Peroxisome average is 13.0 per hepatocyte

Photo/Negative No(s).:L6106-L6610

Significant Lesions (check one): _____ Yes __X__ No

Interpreting Pathologist (signature and date): C A Cummings March 20, 2001

Features:**L6106.** Liver. Hepatocyte. 7,920X. Cells in this micrograph are undergoing autolysis based on a loosely expanded, pale cytoplasm that contains fragmented and dilated endoplasmic reticulum, electron dense mitochondria with no delineated cristae and an indistinct cell membrane. The nucleus is large, round, and still intact. The morphology of the adjoining tissue and cells is similar. In the upper left hand corner, there is a portion of a nucleus but no cell margins. Fourteen (14) peroxisomes are counted.

L6107. Liver. Hepatocyte. 7,920X. In the center of the micrograph, there is an oval shaped hepatocyte with a large distinctly rounded nucleus. Within the cytoplasm of this cell, there are a number of small rounded mitochondria, RER, and two small lipid droplets (on the right hand side of the cell). Nine (9) peroxisomes are counted. In the upper left hand corner of the micrograph adjacent to this central cell, there is a portion of another hepatocyte with similar characteristics.

L6108. Liver. Hepatocyte. 7,920X. Similar to the hepatocyte in **L6106**, the centrally located hepatocyte is undergoing autolysis. The cytoplasm is loosely expanded. RER and mitochondria are observed but loosely arranged. The cell membrane is indistinct. Eleven (11) peroxisomes are observed.

L6109. Liver. Hepatocyte. 7,920X. Similar to the other hepatocytes, the hepatocyte in this micrograph is mildly autolytic. The cytoplasmic organelles are loosely arranged. There are a number of mitochondria, small patches of RER and some SER observed. The nucleus is eccentrically located, round, and small. Twenty-one (21) peroxisomes are counted. Above this hepatocyte located in the upper left hand corner of the micrograph is a large hepatocyte with similar characteristics.

L6110. Liver. Hepatocyte. 18,500X. High magnification of the cytoplasm of a hepatocyte. The nucleus of the cell is present in the upper left hand corner of the micrograph. RER is somewhat dilated while the mitochondria are normal. The cell membrane along the bottom of the micrograph is difficult to discern.

Conclusions: Hepatocytes (5/5) had early autolytic changes most likely due to fixation artifact; therefore, interpretation was limited. One hepatocyte had two small lipid droplets while another had some SER. Peroxisome average is 13.8 per hepatocyte.

Significant Lesions (check one): X Yes _____ No

Interpreting Pathologist (signature and date): [signature] March 20, 2001

Features:**L6138.** Liver. Hepatocyte. 12,100X. Approximately 90% of an oval hepatocyte is observed in this micrograph. The hepatocyte has an eccentric nucleus located at the top of the cell. Mitochondria appear slightly larger. There is an abundance of SER, lesser RER, and randomly scattered glycogen particles in the cytoplasm. A few lipid vacuoles are also observed. Twelve (12) peroxisomes are counted. This hepatocyte is located adjacent to a large sinusoid, located in the upper left hand region of the micrograph.
L6139. Liver. Hepatocyte. 7,920X. A round hepatocyte is found in the center of the micrograph. Surrounding this hepatocyte are portions of other hepatocytes. The central hepatocyte has an eccentrically located round nucleus. In the cytoplasm, numerous mitochondria are found separated by SER, RER, and a few lipid vacuoles. Randomly scattered throughout the cytoplasm are glycogen particles. Twenty (20) peroxisomes are counted.
L6140. Liver. Hepatocyte. 7,920X. In the center of the micrograph, there is a cuboidal-shaped hepatocyte. This hepatocyte has a large round nucleus with a central nucleolus. Two somewhat large lipid vacuoles and two small lipid vacuoles are observed in the cytoplasm along with numerous mitochondria, SER, and RER. Glycogen and a few lysosomes are also observed. Twenty-nine (29) peroxisomes are counted. A bile canaliculus is present above the central hepatocyte.
L6141. Liver. Hepatocyte. 7,920X. A somewhat round hepatocyte is found in the center of the micrograph surrounded on the left and bottom by other similar hepatocytes. The central hepatocyte has a rounded nucleus that is displaced somewhat to the right of the cell. Organelles in the cytoplasm consist of numerous mitochondria, SER, RER, and glycogen. A few lipid vacuoles are observed in the lower left hand portion of the cell. Seventeen (17) peroxisomes are counted.
L6142. Liver. Hepatocyte. 12,100X. High magnification of the cytoplasm of a hepatocyte. A large nucleus is located in the upper left hand corner while another smaller portion of the nucleus is present just below (sectioning artifact). Within the cytoplasm, there is an increase in SER, glycogen along with the numerous mitochondria and randomly scattered RER. Peroxisomes not counted.

Conclusions: A moderate to marked increase in SER. Glycogen is observed in 4/5 hepatocytes. Peroxisome average is 19.5 per hepatocyte.

Photo/Negative No(s).:L6143-L6147

Significant Lesions (check one): _____ Yes X No

Interpreting Pathologist (signature and date): March 16, 2001

Features:**L6143.** Liver. Hepatocyte. 7,920X. Placed somewhat in the center of the micrograph is a horizontally elongated hepatocyte. There is an extreme invagination of the nucleus envelope that contains cytoplasmic organelles, mostly mitochondria and lesser RER. The remaining cytosol contains a rather small number of mitochondria, a few lipid droplets, and slight increase the amount of SER. Fifteen (15) peroxisomes are counted.
L6144. Liver. Hepatocyte. 7,920X. Adjacent to the central hepatocyte are other hepatocytes, some of which contain a few large lipid vacuoles. There are two distinct hepatocytes in the center of the micrograph. The oval-shaped hepatocyte has a centrally located normal round nucleus. Cytoplasmic organelles appear normal. Within the cytoplasm, there are a number of mitochondria, abundant RER, and a few small lysosomes. Nineteen (19) peroxisomes are counted.
L6145. Liver. Hepatocyte. 7,920X. A somewhat rounded to oval hepatocyte, centrally located on the micrograph, is described. The hepatocyte nucleus is centrally located, irregularly rounded, and appears normal. There are a number of mitochondria that are essentially the same in size and shape. Additionally within the cytoplasm, there is abundant RER, multifocal areas of SER and a few randomly scattered lipid droplets. Fifteen (15) peroxisomes are counted.
L6146. Liver. Hepatocyte. 7,920X. Along the lower right-hand corner is a small grid bar segment. A portion of an erythrocyte is found within a sinusoid along the right aspect of the micrograph as well. The centrally located hepatocyte is characterized by a somewhat smaller round nucleus with an eccentrically located small nucleolus, and a cytoplasm filled with numerous mitochondria and patches of RER. The edges of the cell membrane are irregular and somewhat indistinct (fixation artifact). Seventeen (17) peroxisomes are counted.
L6147. Liver. Hepatocyte. 7,920X. There is a hepatocyte vertically centered on the micrograph, a portion of this hepatocyte is cutoff at the bottom. The hepatocyte lacks a nucleus (sectioning artifact). There are a number of mitochondria in the cytosol along with abundant SER and lesser RER. There is a slight increase in the number of lysosomes. Seventeen (17) peroxisomes are counted.

Conclusions: Normal hepatocytes. One hepatocyte had abundant SER while two others have mild SER accumulation. A small amount of lipid is scattered in another hepatocyte. Peroxisomes average 16.6 per hepatocyte.

THIS PAGE REVISED.

Sex: Female

Photo/Negative No(s).: L6188-L6192
L6148, L6149

Significant Lesions (check one): _____ Yes X No

Interpreting Pathologist (signature and date): March 15, 2001

Features: **L6188.** Liver. Hepatocyte. 7,920X. A portion of a sinusoid containing a degenerate cell is found above the centrally located hepatocyte. The hepatocyte is oval shaped. The nucleus of the hepatocyte is round with two similar sized nucleoli and finely granular chromatin. Within the cytosol are numerous small, oval to elongated mitochondria and abundant RER. Nineteen (19) peroxisomes are counted.
L6189. Liver. Hepatocyte. 7,920X. One whole hepatocyte and a portion of another hepatocyte having no nucleus (sectioning artifact) are prominent in the micrograph. The whole hepatocyte is somewhat pyramidal in shape. The nucleus of this hepatocyte is somewhat rounded and contains an eccentrically located round nucleolus. The cytosol is filled with an abundance of RER interlacing around a moderate number of mitochondria. There are a few lipid vacuoles and a few randomly scattered lysosomes. Eleven (11) peroxisomes are counted.
L6190. Liver. Hepatocyte. 7,920X. A portion of a hepatocyte is found in the center of the micrograph. This portion has no nucleus (sectioning artifact) but does contain numerous mitochondria, RER, and a number of lipid droplets. Two of the lipid droplets contain myelin figures. Along the bottom of the micrograph, there is a sinusoid containing clumped erythrocytes. Above the hepatocyte, there is another sinusoid lined by a prominent endothelial cell while in the lumen there are clumped erythrocytes. Peroxisomes are not counted since only approximately 30% of the hepatocyte is available for interpretation.
L6191. Liver. Hepatocyte. 7,530X. A dilated sinusoid is observed along the right hand border of the micrograph. A centrally located, polygonal hepatocyte is observed within the center and adjacent to the bile canaliculus. The nucleus of this hepatocyte is rounded with a somewhat centrally located nucleolus. The cytosol contains abundant RER, a number of small round to often-elongated mitochondria, and a few lysosomes. Nineteen (19) peroxisomes are counted.
L6192. Liver. Hepatocyte. 7,530X. Found along the right hand bottom of the micrograph is a sinusoid containing an erythrocyte, a perisinusoidal fat storing cell (Ito cell), and serum plasma. An oval shaped hepatocyte is observed in the center of the micrograph. The nucleus of this cell is somewhat small compared to the cytoplasm of the cell. The cytosol contains abundant RER, mitochondria, SER, and a few small lysosomes. Sixteen (16) peroxisomes are counted.
L6148. Liver. Hepatocyte. 12,100X. High magnification of a single hepatocyte. The nucleus is round with finely granular chromatin. Adjacent to the nucleus is a large oval lysosome containing reticulo-particulate material. Also within the cytosol are a number of mitochondria and abundant RER. Peroxisomes are not counted since the entire hepatocyte is not available for interpretation.
L6149. Liver. Hepatocyte. 4,990X. An oblong hepatocyte containing abundant mitochondria and RER is located in the center of the micrograph. Thirteen (13) peroxisomes are counted. Along one side of the hepatocyte, there is a sinusoid containing erythrocytes and a clump of cellular debris. In the upper right hand corner is a wide black stripe (folded tissue).

Conclusions: Normal hepatocytes. The average peroxisomes are 15.6 per hepatocyte.

TRANSMISSION ELECTRON MICROGRAPH INTERPRETATION

Study No.: 6329-183 EM 01.37

Species/Strain: Cr:CD® (SD) IGS BR

Animal No.: C92874

Tissue: Liver – Centrilobular

Treatment Group: 1 (Control)

Block No(s).: C92874 2A

Sex: Female

Photo/Negative No(s).:L6150-L6154

Significant Lesions (check one): _____ Yes __X__ No

Interpreting Pathologist (signature and date): March 15, 2001

Features: **L6150.** Liver. Hepatocyte. 7,530X. A centrally located hepatocyte is bordered on all four sides by sinusoids containing erythrocytes. This hepatocyte is irregular in shape, somewhat rounded with a round central nucleus. The cytosol contains numerous mitochondria, some RER, and a few lipid droplets. Ten (10) peroxisomes are counted.
L6151. Liver. Hepatocyte. 7,530X. A rounded hepatocyte is found in the center of the micrograph. This hepatocyte has a distinctly round nucleus. The cytosol contains numerous mitochondria and abundant RER. A few lysosomes with reticulo-particulate material are also noted. Sixteen (16) peroxisomes are counted. A dilated sinusoid with numerous erythrocytes is found on the right hand size at the top of the micrograph. Along the left hand margin, there is a hole (artifact).
L6152. Liver. Hepatocyte. 7,530X. Two hepatocytes are found on this micrograph. One hepatocyte has a single nucleus. The other hepatocyte is binucleated. Both nuclei are rounded with one slightly bigger than the other. The large nucleus has a single nucleolus. There are numerous small mitochondria and a moderate amount of RER. A sinusoid is noted with erythrocytes along the lower left corner and just above the binucleated hepatocyte on the upper right side of the micrograph. Twenty-three (23) peroxisomes are counted.
L6153. Liver. Hepatocyte. 4,990X. Two hepatocytes are observed in this micrograph. The one at the top edge of the micrograph is cut almost in half. The other hepatocyte is located somewhat in the center of the micrograph slightly to the left hand margin. This hepatocyte has an eccentrically located round nucleus that contains finely stippled chromatin. The cytosol is filled with small mitochondria, RER, and a few small lysosomes. Seventeen (17) peroxisomes are counted.
L6154. Liver. Hepatocyte. 7,530X. In this micrograph, there is a single centrally located hepatocyte surrounded by portions of other hepatocytes and a sinusoid containing two small erythrocytes (along the right hand margin). The central hepatocyte has a rounded nucleus with two round nucleoli. The cytosol contains abundant RER, less SER, a mild amount of randomly scattered glycogen, and numerous small rounded mitochondria. One large lipid droplet with a myelin figure is also observed. Sixteen (16) peroxisomes are counted.

Conclusions: Normal hepatocytes. One hepatocyte had a small amount of SER while another had a few lipid droplets. Peroxisomes average 16.4 per hepatocyte.

Significant Lesions (check one): _____ Yes ___X___ No

Interpreting Pathologist (signature and date): March 16, 2001

Features:**L6155.** Liver. Hepatocyte. 7,530X. Central to the micrograph is a hepatocyte that is somewhat pyramidal in shape. The nucleus is centrally located and round. There are two small nucleoli and finely granular chromatin within the nucleus. The cytosol contains numerous similar sized mitochondria, abundant RER, scant SER, and a few lipid droplets and lysosomes. The plasma membrane in areas is somewhat difficult to discern from adjacent hepatocytes. Twenty-one (21) peroxisomes are counted.
L6156. Liver. Hepatocyte. 10,200X. A higher magnification of a hepatocyte characterized by numerous mitochondria, RER, and SER. A few lipid droplets are also found. Peroxisomes not counted.
L6157. Liver. Hepatocyte. 7,920X. The centrally located oval-shaped hepatocyte contains a slightly eccentrically located nucleus containing one nucleolus. The cytosol contains numerous mitochondria, RER, scant SER, and variable sized lipid droplets. Twenty-two (22) peroxisomes are counted.
L6158. Liver. Hepatocyte. 7,920X. Along the right hand margin of the micrograph there is a bile canaliculus. An erythrocyte in the upper right hand corner is within the duct. There is a rounded hepatocyte in the center of the micrograph that contains a number of mitochondria interwoven with patches of RER and SER. The nucleus is slightly eccentrically located, small, and indented along one edge. A few lipid droplets are present in the right hand portion of the cell. A particle of debris is present in cytosol in the lower half of the cell. Twenty (20) peroxisomes are counted.
L6159. Liver. Hepatocyte. 7,920X. Centrally located on the micrograph is an oval binucleate nucleus. In one of the nuclei, there is a small eccentrically located nucleolus. Within the cytosol, there are numerous mitochondria and RER. Randomly scattered are small patches of SER. This hepatocyte is bordering a bile canaliculus on the lower right hand corner of the micrograph. Twenty-eight (28) peroxisomes are counted.

Conclusions: Normal hepatocytes. SER is minimally increased. The peroxisome average is 22.8 per hepatocyte.

Significant Lesions (check one): _____ Yes X No

Interpreting Pathologist (signature and date): [signature] March 19, 2001

Features: **L6160.** Liver. Hepatocyte. 7,920X. Two hepatocytes are observed in this micrograph. In the upper left hand corner, there is one half of one hepatocyte. The other hepatocyte is centrally located on the micrograph. This hepatocyte is polygonal in shape with an eccentrically located nucleus. The chromatin in the nucleus is finely granular. There are numerous mitochondria and RER in the cytosol. A few randomly scattered lysosomes are also observed. Fourteen (14) peroxisomes are counted.

L6161. Liver. Hepatocyte. 7,530X. A single whole hepatocyte is located in the center of the micrograph. Surrounding this hepatocyte are portions of other hepatocytes. There is a sinusoid along the left hand margin that contains a leukocyte. The central hepatocyte is somewhat oval with tapered ends. The nucleus is irregularly rounded with clumped chromatin and one small nucleolus. The cytosol contains numerous mitochondria and RER. A few randomly scattered lysosomes are also observed. Sixteen (16) peroxisomes are counted.

L6162. Liver. Hepatocyte. 7,530X. A binucleated hepatocyte located somewhat on the left side of the micrograph is described. The nuclei are round and similar in size. One nucleus has a small nucleolus. The cytosol is packed with mitochondria and RER. Along the upper left hand margin of the micrograph, there is a clearing of the hepatocytes (artifact). Seventeen (17) peroxisomes are counted.

L6163. Liver. Hepatocyte. 7,530X. The micrograph is slightly dark. A single whole hepatocyte is observed in the center of the micrograph. Cell margins are difficult to discern completely. The hepatocyte has a large eccentrically located nucleus with two dense somewhat rounded nucleoli. The cytosol contains numerous mitochondria and RER. A small amount of SER, a few small lysosomes, and a few variable-sized lipid droplets. Nineteen (19) peroxisomes are counted.

L6164. Liver. Hepatocyte. 10,200X. Approximately 90% of a hepatocyte is located along the bottom central region of the micrograph. The nucleus of this cell is small and rounded. Chromatin is coarse. The cytosol contains numerous similar-sized mitochondria and RER. Fifteen (15) peroxisomes are counted. Two other hepatocytes are observed in the upper region of the micrograph.

Conclusions: Normal Hepatocytes. One hepatocyte had a small amount of SER and a few variable sized lipid droplets. Peroxisomes average 16.2 per hepatocyte.

Significant Lesions (check one): X Yes ____ No

Interpreting Pathologist (signature and date): March 19, 2001

Features: **L6111.** Liver. Hepatocyte. 7,920X. In the center of the micrograph, there is a cuboidal shaped slightly larger hepatocyte. The hepatocyte contains a large round nucleus with finely granular chromatin. Within the cytosol, there are a number of small round mitochondria interwoven by RER. Surrounding the nucleus and along the outer periphery of the cell is a moderate amount of SER. Thirty-nine (39) peroxisomes are counted.
L6112. Liver. Hepatocyte. 10,200X. A cuboidal shaped hepatocyte is observed in the center of the micrograph. The nucleus is somewhat rounded with irregular indentation of the nuclear membrane. Chromatin is clumped along the periphery of the nucleus. There is a centrally located single nucleolus. Numerous mitochondria, RER, and lysosomes are distributed within a loosely expanded cytoplasm. Twenty-four (24) peroxisomes are counted.
L6113. Liver. Hepatocyte. 7,920X. The quality of the micrograph is poor. There is a significant amount of lysosomes present; however, no further interpretation is done.
L6114. Liver. Hepatocyte. 7,920X. Two hepatocytes are observed in this micrograph, one is located along the left hand margin while the other is adjacent to the right hand margin of the micrograph. Approximately 90% of the hepatocyte on the right is present. This cell has a centrally located, distinctly rounded nucleus with one round eccentric nucleolus. Numerous mitochondria, RER, some SER, and a number of lipid vacuoles are present in the cytosol. Twenty-two (22) peroxisomes are counted.
L6115. Liver. Hepatocyte. 12,100X. A high magnification of the cytoplasm of a hepatocyte, the nucleus of the cell is located in upper right hand corner of the micrograph. Mitochondria, RER, and a few lysosomes are found in the cytosol. Peroxisomes not counted. A bile canaliculus is found along the left lower edge of the cell.
L6202. Liver. Hepatocyte. 7,920X. An oval, somewhat larger hepatocyte is observed in the center of the micrograph. The nucleus of this cell is large, round, and contains one nucleolus. The cytosol contains numerous similar-sized mitochondria, RER, SER, and a few randomly scattered small lysosomes. Along the bottom edge of the cells, there is a cluster of lipid vacuoles. Twenty-five (25) peroxisomes are counted. A portion of another hepatocyte adjacent on the lower right also contains a number of lipid vacuoles.

Conclusions: Mild hepatocellular hypertrophy (2/6 hepatocytes). SER is increased in 3/6 hepatocytes while lipid is prominent in 2/6 hepatocytes. Peroxisome average is 27.5 per hepatocyte.

Significant Lesions (check one): X Yes _____ No

Interpreting Pathologist (signature and date): [signature] March 19, 2001

Features: **L6165.** Liver. Hepatocyte. 7,530X. A cuboidal-shaped bi-nucleated hepatocyte is found in the center of the micrograph. The nuclei are similar in shape and size. Both nuclei have a centrally located nucleolus. In the cytosol, there are a number of slightly larger round mitochondria. RER and lysosomes are also observed. Twelve (12) peroxisomes are counted.

L6166. Liver. Hepatocyte. 7,530X. In the center of the micrograph is an oval to slightly rounded bi-nucleated hepatocyte. The nuclei of this cell are rounded and similar in size. One nucleus contains two nucleoli while the other has only one. The cytosol contains a number of slightly larger mitochondria, RER, and a few clustered lysosomes. Twelve (12) peroxisomes are counted. A portion of four other hepatocytes surrounds this hepatocyte. A large erythrocyte is found adjacent to the hepatocyte on the left hand side of the micrograph.

L6167. Liver. Hepatocyte. 7,920X. This micrograph contains portions of two adjacent hepatocytes. Approximately 50% of the hepatocyte on the right is present. The nucleus of this cell is distinctly rounded, larger than normal, with a marginating nucleolus. The cytosol contains numerous mitochondria that appear slightly enlarged. RER and clustered lysosomes are also observed. Peroxisomes not counted.

L6168. Liver. Hepatocyte. 7,920X. An oval hepatocyte is located horizontally in the center of the micrograph. To the left of this cell is a portion of another hepatocyte. To the right of the central hepatocyte is a sinusoid containing lipid droplets and an erythrocyte. The central hepatocyte contains a large oval nucleus with two slightly eccentric nucleoli. Within the cytosol, there are a number of large round mitochondria, RER, and a large cluster of lysosomes along the left hand edge of the cell. In addition, individual lysosomes are found randomly scattered within the cytosol. Peroxisomes not counted. Cell borders are difficult to discern in some areas. An electron dense thin circular artifact is found on the left edge of the micrograph. Additionally, there are a scattered tissue fissures over the entire micrograph (artifact).

L6169. Liver. Hepatocyte. 7,920X. An oval shaped hepatocyte is found slightly to the right of the center of the micrograph. A large slightly rounded nucleus is located along the bottom portion of the cell. Numerous small round tightly packed mitochondria and a large cluster of lysosomes is found in the cytosol. The lysosomes are located adjacent to the nucleus. In addition, a small amount of randomly scattered RER is also located in the cytoplasm. Peroxisomes are increased-sixty (60) are counted.

L6170. Liver. Hepatocyte. 7,920X. A single cuboidal hepatocyte is found in the center of the micrograph. The nucleus is rounded with one marginating nucleolus. The cytosol is packed with small round mitochondria, lysosomes, and a small accumulation of RER. The left edge of the cell contains a few chatter lines (tissue artifact). Twenty-three (23) peroxisomes are counted.

Conclusions: *Mitochondria appear slightly larger in 4/6 hepatocytes. Peroxisome average is 26.8 per* hepatocyte.

Significant Lesions (check one): X Yes_____ No

Interpreting Pathologist (signature and date): [signature] March 20, 2001

Features: **L6171.** Liver. Hepatocyte. 7,920X. A large polygonal hepatocyte is located horizontally in the center of the micrograph. The nucleus of this cell is quite small while the cytoplasm is extremely distended with small round mitochondria, RER, and SER. There are a few randomly scattered small lysosomes as well. Thirty-eight (38) peroxisomes are counted.
The left hand edge of the hepatocyte contains a number of villous projections. A small leukocyte and an erythrocyte are found along the bottom right hand margin of the micrograph.
L6172. Liver. Hepatocyte. 7,920X. A number of hepatocytes are present in this micrograph. One cuboidal-shaped hepatocyte, vertically centered in the middle of the micrograph is characterized by a distinctly large round eccentrically located nucleus having a rather large dense nucleolus. The cytosol of this cell is packed with numerous small mitochondria, RER, and a few small patches of SER. Sixteen (16) peroxisomes are counted. The hepatocyte is bordered on three sides by sinusoids that contain erythrocytes. Adjacent to the edge where the nucleus is located, there is a perisinusoidal fat storing cell (Ito cell) within a dilated sinusoid.
L6173. Liver. Hepatocyte. 7,920X. A large polygonal hepatocyte is found located in the center of the micrograph. This hepatocyte has a small nucleus compared to the cytoplasm that is greatly distended with small mitochondria, RER, and SER. Eleven (11) peroxisomes are counted. The plasma membrane contains a number of villous projections. A number of hepatocytes surround the central hepatocyte. These hepatocytes also contain numerous mitochondria, RER, and SER. A portion of one hepatocyte, located along the upper right hand corner of the micrograph, has an abundance of glycogen.
L6174. Liver. Hepatocyte. 7,920X. A cuboidal shaped hepatocyte is found located vertically in the center of the micrograph. The left and right hand edges of the plasma membrane contain numerous villous projections. A nucleus is not observed (sectioning artifact). The cytoplasm contains large patches of SER, RER, and a moderate number of mitochondria. There are a few lipid vacuoles and a noticeable increase in the amount of glycogen. Ten (10) peroxisomes are counted. Between this hepatocyte and the hepatocyte at the bottom of the micrograph is a small bile canaliculus.
L6175. Liver. Hepatocyte. 7,530X. A large round hepatocyte with a small portion of the nucleus (sectioning artifact) is found in the center of the micrograph. This cell is characterized by large numbers of small mitochondria, abundant SER, and lesser RER. Fifteen (15) peroxisomes are counted. Surrounding this hepatocyte are portions of other hepatocytes.
L6176. Liver. Hepatocyte. 7,530X. A smaller hepatocyte is located in the center of the micrograph surrounded by dilated sinusoids. The hepatocyte has no nucleus (sectioning artifact). Within the cytosol, there are a number of small elongated to round mitochondria, SER, and RER. A large lipid vacuole and randomly scattered deposits of glycogen are also observed. Twenty (20) peroxisomes are counted. In the upper right hand corner of the micrograph is a sinusoid containing a small leukocyte. Below and to the right of the central hepatocyte, there is a small hole (sectioning artifact).

Conclusions: Hepatocellular hypertrophy (4/6 hepatocytes). SER is increased in 5/6 hepatocytes. One hepatocyte has scattered deposits of glycogen. Peroxisome average is 18.3 per hepatocyte.

Significant Lesions (check one): X Yes _____ No

Interpreting Pathologist (signature and date): March 20, 2001

Features: **L6177.** Liver. Hepatocyte. 7,530X. An oval hepatocyte is found located vertically in the center of the micrograph. Above this hepatocyte, there is a sinusoid lined by a prominent endothelial cell that contains one small leukocyte and two large lipid droplets. Lipid droplets are located over the entire micrograph both within the central hepatocyte and well as other hepatocytes above and below. The central hepatocyte has a oval shaped nucleus with finely granular chromatin. The cytosol of this cell contains numerous small round mitochondria and surrounding the nucleus is a thick zone of RER. Small patches of SER are also observed. Twenty-three (23) peroxisomes are counted. There is a large knife mark (artifact) running along the bottom edge of the cell.

L6178. Liver. Hepatocyte. 3,750X. A number of hepatocytes are observed in this micrograph. An oval hepatocyte is found vertically placed in the center of the micrograph. The cell membrane has a number of villous projections especially prominent on the lower half of the cell. The nucleus of this cell is small and contains three nucleoli; one is distinctly round and larger than the others. Within the cytosol, there is an increase in the amount of SER and lesser numbers of mitochondria and RER. Eighteen (18) small peroxisomes are counted. Lipid droplets are observed along the top edge of the cell as well as scattered along the bottom. Lipid droplets are found scattered throughout other hepatocytes surrounding this cell. At the top of the micrograph, located in the center, is an electron dense, elongated trapezoid artifact.

L6179. Liver. Hepatocyte. 4,990X. An oval hepatocyte is found in the center of the micrograph. Above this hepatocyte is a sinusoid containing cellular debris and a nucleus of a leukocyte. The central hepatocyte contains a distinctly round somewhat eccentric nucleus. A small round eccentric nucleolus is found in the nucleus. The cytosol contains a dense population of small mitochondria, RER, and a few patches of SER. Twenty-two (22) peroxisomes are counted. A tissue fold is observed at the bottom of the micrograph.

L6180. Liver. Hepatocyte. 4,990X. A polygonal hepatocyte with a small nucleus is found in the center of the micrograph. The hepatocyte is somewhat separated from adjacent hepatocytes by dilated sinusoids containing erythrocytes. The cytoplasm of this cell contains a number of thin elongated mitochondria, some RER, and a few patches of SER. A few small lipid droplets are also observed. Seventeen (17) peroxisomes are counted.

L6181. Liver. Hepatocyte. 4,990X. The hepatocyte in this micrograph is the same one as the hepatocyte in micrograph **L6180.**

L6182. Liver. Hepatocyte. 7,530X. A higher magnification of the cytoplasm of a hepatocyte. The nucleus of the hepatocyte is distinctly rounded and located in the upper left corner of the micrograph. The cytoplasm of this cell contains a number of small mitochondria, RER, and numerous patches of SER. A few small randomly scattered lipid droplets are found also within the cytosol. A few lysosomes and minute glycogen particles are similarly observed. Peroxisomes not counted.

Conclusions: Mild hepatocellular hypertrophy (3/5 hepatocytes). The amount of SER is increased in 5/5 hepatocytes while 4/5 hepatocytes have lipid accumulation. One hepatocyte also has scattered glycogen. Peroxisome average is 20.0 per hepatocyte.

Significant Lesions (check one): X Yes _____ No

Interpreting Pathologist (signature and date): [signature] March 20, 2001

Features: **L6193.** Liver. Hepatocyte. 7,920X. A large somewhat rounded hepatocyte is found located in the center of the micrograph. The nucleus of the cell is centrally located, distinctly rounded with slight clumping of chromatin. The cytosol of this cell is filled with numerous mitochondria and RER. A few small lysosomes and lipid droplets are also observed. Twelve (12) peroxisomes are counted. A portion of another hepatocyte is observed along the bottom of the micrograph. Within the cytoplasm of that cell, there are a few small deposits of lipofuscin.
L6194. Liver. Hepatocyte. 7,920X. Two oval hepatocytes are found vertically aligned in this micrograph. The bottom hepatocyte contains a large, somewhat rounded nucleus with an eccentrically located nucleolus. Within the cytosol of this hepatocyte, there are numerous mitochondria, RER, and a few large lipid vacuoles. A few randomly scattered, small, patches of SER are also observed. Peroxisomes not counted due to darkness of the micrograph. The hepatocytes above and below this hepatocyte also contain a number of lipid vacuoles.
L6195. *Liver. Hepatocyte. 7,920X. Approximately 90% of a large (fills the entire micrograph) hepatocyte is* described. The nucleus is distinctly rounded and contains two large round nucleoli. The cytoplasm contains numerous small mitochondria, RER, and SER. In addition, there are numerous variable-sized lipid droplets also observed. Some of these droplets contain debris. Twenty-one (21) peroxisomes are observed.
L6196. Liver. Hepatocyte. 10,200X. A pyramidal-shaped hepatocyte, located in the center of the micrograph, is described. This cell has an eccentrically located, rounded nucleus. The chromatin in the nucleus is somewhat clumped along the periphery. There is a large lipid droplet in upper right hand corner of the cell. Numerous small elongated to rounded mitochondria, abundant RER and scattered SER are also observed in the cytoplasm. Ten (10) peroxisomes are counted. This hepatocyte is somewhat surrounded on three sides by sinusoids that are dilated and filled with cellular debris, erythrocytes, and one small leukocyte (along the upper left hand edge of the micrograph).
L6197. Liver. Hepatocyte. 10,200X. The centrally located, oval hepatocyte is somewhat distorted (tissue artifact). The nucleus is distinctly rounded, large, with one large and one small nucleolus. The left hand portion of the cytoplasm contains a number of large lipid vacuoles and SER while the bottom half or right hand portion of the cytoplasm contains clustered mitochondria and RER along with a few other lipid vacuoles. An even smaller number of lysosomes are found scattered randomly throughout the cell. Twenty-two (22) peroxisomes are counted. A large erythrocyte in a dilated sinusoid is noted along the upper right hand portion of the micrograph.
L6198. Liver. Blood vessel. 4,990X. There is extensive widening of the cytoplasm of the endothelial cells. The nuclei of the endothelial cells are enlarged with finely granular chromatin. Within the center of this vessel, there is a portion of a circulating leukocyte. Adjacent to this vessel is another large lumen (at the bottom left hand corner). The top of the micrograph is dark and not interpreted.
L6199. Liver. Hepatocyte. 10,200X. High magnification of the cytoplasm of a hepatocyte. Within the cytosol, there are a number of large lipid droplets, lipofuscin particles, SER, RER, and mitochondria. Peroxisomes not counted.

Conclusions: Hepatocellular hypertrophy (4/6 hepatocytes). SER is increased in 6/6 hepatocytes. Lipid is present in 4/6 while one hepatocyte has lipofuscin. Peroxisome average is 16.3 per hepatocyte.

THIS PAGE REVISED.

SECTION III

TRANSMISSION ELECTRON MICROGRAPHS

FIGURE LEGENDS

Magnification. Print magnification is indicated on the back of each photograph. The Bar in the right-hand corner of the micrograph equals 1micron (0.001mm).

Figure 1. Liver. Hepatocyte. This hepatocyte illustrates a few normal ultrastructural features. Within the cytosol, there are a number of mitochondria separated by abundant RER. SER is scant to not seen in this hepatocyte. Animal no. C92871, Control Female.

Figure 2. Liver. Hepatocyte. A binucleated hepatocyte located somewhat on the left side of the micrograph also illustrates normal organelles. The cytosol is packed with small round mitochondria, and a few small aggregates of RER. Animal no. C92897, Control Female.

Figure 3. Liver. Hepatocyte. A high magnification of the cytoplasm of a hepatocyte is illustrated. The nucleus of the hepatocyte is found at the bottom of the micrograph. Within the cytosol, there are a number of mitochondria with normal lamellar cristae, abundant RER, and randomly scattered lysosomes. A bile canaliculus is observed separating this hepatocyte from another hepatocyte at the upper right hand top of the micrograph. Animal no. C92505, Control Male.

Figure 4. Liver. Hepatocyte. An enlarged cuboidal-shaped hepatocyte is found in the center of the micrograph. The cytoplasm is distended due to a large increase in SER and less RER. A moderate number of mitochondria and a few lipid droplets are also observed in the cytoplasm. Animal no. C92762, High dose treated Male.

Figure 5. Liver. Hepatocyte. A large polygonal hepatocyte is found in the center of the micrograph. This hepatocyte has a small nucleus compared to the cytoplasm that is greatly distended with small mitochondria, RER, and SER. The plasma membrane contains a number of villous projections. Surrounding hepatocytes contain numerous mitochondria, RER, and SER. A portion of one hepatocyte, located along the upper right hand corner of the micrograph, has a large amount of glycogen. Animal no. C93125, High dose treated Female.

Figure 6. Liver. Hepatocyte. A round hepatocyte is found in the center of the micrograph. Randomly scattered are numerous mitochondria, RER, and a cluster of lipid vacuoles located in the lower portion of the cytoplasm. Surrounding the lipid vacuoles is a dense accumulation of glycogen. A sinusoid containing erythrocytes is noted on the lower left hand portion of the micrograph. Animal no. C92762, High dose treated Male.

FIGURE LABELS FOR ULTRASTRUCTURAL STRUCTURES

Abbreviations	Structure
BC	Bile canaliculus
DC	Degenerate cell
G	Glycogen
L	Lipid droplet
LY	Lysosome
M	Mitochondria
N	Nucleus
NU	Nucleolus
P	Peroxisomes
RBC	Erythrocyte
RER	Rough endoplasmic reticulum
SER	Smooth endoplasmic reticulum
VP	Villous projection

QUALITY ASSURANCE STATEMENT

PATHOLOGY ASSOCIATES
A CHARLES RIVER COMPANY

QUALITY ASSURANCE STATEMENT

The electron microscopy portion of this study has been inspected and audited by the Quality Assurance Unit of Pathology Associates International, as required by the Good Laboratory Practice regulations promulgated by the U.S. Food and Drug Administration. PAI has a functioning and responsive quality assurance unit which reports directly to management. The following is a record of inspections/audits and their resulting reports:

Date of Inspection	Phase Inspected	Date Reported to Management and Project Manager
03/14/01	Darkroom Procedures	03/14/01
03/29, 30/01	Audit of Data and Draft Report	03/30/01
11/29/01	Audit of Amended Final Report	11/29/01
