For our pages on Paints, see Manufacturers' Index.

Hoyt Hardlead

Hoyt Hardlead has a much greater tensile strength than soft lead, which permits its use in comparatively thin sheets, making it thoroughly practical and adaptable to modern building construction. It can be stamped, formed or cast in any shape desired. When exposed to the atmosphere it takes on a soft gray, non-staining patina that brings out the true value of adjacent materials and gives a balance to these materials that cannot be obtained with other metals. It will lend dignity and character to any structure where permanence and beauty are desired. It is used for roofing, flashings, cornice coverings and other building purposes where it is practical to use sheet metal.

It is rolled in sheets 24, 30 and 36 in. wide and 96 in. long, weighing $2\frac{1}{2}$, 3, 4, 6 and 8 lb. to the sq. ft. The proper weight of Hoyt Hardlead Sheets depends upon the purpose for which they are to be used. For roofing, cornice coverings and base flashings generally the 3-lb. sheet is recommended, and for cap flashings and batten roofs where the battens are spaced 24 in. or less on centers the $2\frac{1}{2}$ -lb. sheet may be used.

FROMMAN, ROSS & LITTLE, Boston, Mass., Architects

Spandrels

Architecturally and economically there are many advantages in the use of Hoyt Hardlead Spandrels. It is possible to obtain in Hoyt Hardlead effects that cannot be duplicated in other materials which in contrast present an extreme severity of line. Softness of line and low relief are characteristics of stamped Hoyt Hardlead.

The soft gray color of Hoyt Hardlead is uniform and permanent.

Unlike other metals, Hoyt Hardlead Spandrels require no painting nor other maintenance, and do not stain adjacent masonry.

Catalogue

Our catalogue illustrates a complete line of architectural and ornamental Hoyt Hardlead work. This catalogue will be sent to architects on request.
