BUSINESS
WEEK

RESEARCH

SURVEYING the field: Dr. Leonard Greenburg, New York State Dept. of Labor, and Dr. May R. Mayers, chairman, Occupational Cancer Committee, join up with . . .

Industry Against Cancer

New group, representing industry and medical and government authorities, maps fight on country's No. 2 killer. First step: a survey that will help determine industrial danger spots.

Science and industry are joining forces to take on a powerful antagonist: occupational cancer. The size of the job can be gaged by the fact that cancer now rates as the second biggest killer in this country.

This week, the growing hazards of occupational cancer were the theme of a paper by cancer authority Dr. W. C. Hueper, of the National Cancer Institute. The occasion was a meeting of the American Public Health Assn. in Boston. Dr. Hueper's point: The more modern industry develops, the more vital is a study of potential industrial danger spots.

• **Starter**—Just such a study is the goal of New York State's brand-new Occupational Cancer Committee, an unofficial agency. Members have been working on a two-year program. They have a special fund from National Cancer Institute of the U.S. Public Health Service of \$32,694 a year to go on. Ohio and New Jersey are getting similar grants.

Industry has representatives on the committee—Dr. G. H. Gehrmann, for Manufacturing Chemists Assn.; and Dr. Arthur F. Hoag, for American Petro-

representatives from the U.S. Public Health Service, from New York State Depts. of Labor and Health, as well as from the medical and scientific centers. Chairman of the new group is Dr. May R. Mayers, chief, Medical Unit, Div. of Industrial Hygiene, N. Y. State Dept. of Health.

The committee knows very well that its job will be tough. For one thing, nobody really knows how big the problem is. As Dr. John R. Heller, Jr., director of the National Cancer Institute, reported last week to the American Cancer Society, there are no figures to show how many people are dying today from environmental or industrial cancer. No one knows, even, how many people are exposed to it, or where the precise danger lies.

• **Program**—But with this nebulous start, the committee has lined up its immediate plans:

(1) A pilot study at the Roswell Park Memorial Hospital, Buffalo. This, the first large-scale survey of its kind, will cover 5,000 male cancer patients; 1,000 male non-cancer patients will serve as a control.

(2) The distribution of a leaflet on

PORTLAND CEMENT now helps the Iron Horse run smoother

TRAIN PASSENGERS are enjoying new standards of comfort because of portland cement "grout," a mixture of portland cement, sand and water, which, when pumped into soft spots and water pockets under tracks, hardens and stabilizes the roadbed. More than 45 major railroads are now pressure grouting with portland cement to obtain a smoother riding track and to reduce maintenance and operating costs.

This is another example of the thousand ways that portland cement and concrete serve and save. Concrete is the favored material for streets and highways because it is smooth-riding and lasts longer—at lower cost to taxpayers.

Concrete also provides strength, beauty, firesafety and **low-annual-cost** service for school buildings, hospitals, apartments, factories and municipal structures.

Concrete is a wise investment for homes and farm buildings because it is firesafe, stormproof, ratproof, decay-proof, termite-proof, easy to heat, inexpensive to maintain.

Yes, you can depend on concrete for better service and better living—and be money ahead in the long run too.

PORTLAND CEMENT ASSOCIATION

clinics, and all physicians in the state who are interested in cancer.

The pilot survey is out to track down what chemicals or other occupational factors may be considered among the possible causes of cancer. Dr. Mayers reports that industrial chemicals can, in general, be used with perfect safety if adequate control measures are instituted. But in order to get the best control measures, you first have to know what chemicals offer the threat.

Specially trained personnel will take detailed occupational histories of all cancer patients who enter the Roswell Park Memorial Hospital. The interviewer will try to pin down just what the patient's occupational exposure was, what chemical substances he came in contact with, what other environmental factors were present in the workroom. Since cancer will usually develop only after a great many years of exposure—and even many years after exposure—

CANCER AUTHORITY: Dr. W. C. Hueper has ideas on how to tackle the problem of occupational cancer

this means tracing the patient's history all the way back to his first job.

• **Sleuthing**—If a clue—however elusive—turns up at any point, a chemist will be called in. His job will be to unearth any positive proofs that a chemical suspect may have been the source of the disease. The data will be entered on punch cards. These will be used as the base for a complete statistical study to be carried out by the Division of Cancer Control of the N. Y. State Dept. of Health, under the direction of Dr. Paul Gerhard.

The committee is ready to follow any suspected case right into the workroom

analysis of materials, radiation measurements, chemical analysis of air contaminants—dusts, gases, fumes, and the like. That way, it is hoped that occupational factors that are not now suspected of causing cancer may be brought to light.

• **Investigation Points**—Dr. Hueper's paper broke down the known and suspected cancer causing agents into:

Physical Agents: These include ultraviolet rays, X-rays, and other radioactive substances.

Chemical Agents: Inorganic chemicals, such as arsenicals, chromates, nickel carbonyl, asbestos; organic chemicals such as aromatic compounds, amines, benzol, and the undefined compounds responsible for the cancer-causing action of tar, pitch, asphalt, soot, carbon black, paraffin oil, creosote, and various crude and processed mine oils, shale oils, and some products derived from them.

With this list of suspects, the medical authorities are particularly interested in industries using these materials. As Dr. Heller put it "As far as we know the most dangerous areas are in the field of radioactive substances, the areas of hydrocarbon research and development such as the high-temperature distillation and fractionation of petroleum; and the wide field of organic chemistry which is developing new synthetic chemicals."

Neutron Counter

This tiny neutron counter is expected to ease one of the toughest jobs of the atomic researcher. It was recently developed by Dr. Kuan-Han Sun, Chinese-born physicist at the Westinghouse Research Laboratories. Neutrons are difficult to detect because they carry no electrical charge. But neutrons split uranium atoms. So the detector includes a film of uranium-235. A photosensitive plate responds to the radiation from the atomic fission by emitting electrons which are collected and counted.

...Three TRUCKS- Nine TRAILERS MOVE FACTORY OUTPUT!

TO MOVE the entire output of one of the world's largest electric cleaner factories 6 miles to a railhead might seem like a difficult problem—but not to The Hoover Company.

With a fleet of 9 Fruehaufs and 3 Mack truck-tractors to pull them, the factory at North Canton, Ohio, has literally been moved onto the main line.

"Shuttle System"—The Answer!

Each truck does triple duty. While some of the nine Trailers are being loaded at the factory, others are unloading at the railhead, while the three trucks and remaining Trailers are in transit. A further saving results from the fact that each Trailer returning from the railhead is loaded with raw materials for the production lines. There's no waste motion in either direction.

The savings in initial equipment and operating cost are really worthwhile. The first Fruehauf bought in 1929—still in service—demonstrated it so well that more and more units were added as the company grew.

Trailers Save Money for Industry!

Trailers are doing a splendid job for industry. They link plants, put stockpiles on wheels and handle direct deliveries more economically than by any other method.

Surely, it's worth investigating in your case, so why not let a Fruehauf man show you how much more productive your trucks can be by coupling them to Trailers?

billion earmarked for ECA loans; each country in which there's ECA-backed investment loses that much from its loan allocation.

Western European nations don't think that most of the proposed investments would give them as much for their dollars as a straight loan. They might buy the guarantee idea if it were offered in addition to a given country's total allocation of dollars.

Reports From Abroad

Allied military authorities in Germany have approved several small investments by U.S. publishers to be covered by ECA's guarantee fund. MacFadden Publications International Corp. and Fawcett Publications, Inc., were guaranteed conversion of earnings in German currency up to \$87,000 for the coming year.

This is what the Germans get: 10,000 assorted comic books a month, plus copies of True Confessions, Starting Detective, True Police Cases, and Movie Story. Moreover, MacFadden intends to publish a German edition of True Story.

Occupation-Generals Clay and Robertson approved. They did so because they could find nothing "Nazi or unsuitable from a security point of view."

Forge-Proof Licenses

This printing press at Todd Co., Inc., Rochester, N. Y., is turning out export license forms designed to foil the cleverest forger. It is part of Commerce Dept.'s drive against export racketeers (BW-Jul.17'48,p108). The Todd process makes export licenses as safe as banknotes. A surface pattern of dots, arranged in a complex mathematical formula, is printed on each form. The formula was destroyed for secrecy after the printing plates were made.
