Disposal of the incinerator effluent stream at Discharge Point 001, the outfall of the wastewater treatment facilities at Burlington, has been approved by DRBC. Based on the data supplied by Process Design, the maximum salt production will be 2400-2500 lb/day. The salt solution should be directed to the outfall via the existing cooling tower blowdown line.

It has been determined that the effluent will continue to meet applicable water quality standards.
