

LEAD INDUSTRIES ASSOCIATION

60 EAST 42ND STREET

NEW YORK 17, N. Y.

May 20, 1959

SUBJECT: PAPER PRESENTED BEFORE
BRIDGE DIVISION, AASHTO

To Members of the Lead Pigments Divisions:

Attached please find a copy of the paper "An Innovation in Painting Steel," presented by Owen P. Shobe at the meeting of the Bridge Division, American Association of State Highway Officials, at the Benjamin Franklin Hotel, on May 21, 1959. The paper was approved by the members of the Lead Pigments Technical Committee.

In addition to the actual presentation of the paper at the Philadelphia meeting, copies were distributed at other regional meetings of the Bridge Division, as follows:

- May 11-12 - Hotel Utah
Salt Lake City, Utah
- May 14-15 - Hotel Sheraton Jefferson
St. Louis, Missouri
- May 18-19 - Hotel Redmont
Birmingham, Alabama

Additional copies of this paper are available upon request.

Sincerely yours,

R. L. L. L. L.
Secretary

AN INNOVATION IN PAINTING STEEL *Introduction

Advances in paint prices and labor costs during the past few decades have brought about a continuous effort to formulate better paints and to improve painting practice. H.H.Uhlir, in an article entitled "Costs of Corrosion in the United States," which appeared in "Corrosion," January, 1950 issue, estimated the total cost of corrosion in the United States to be 5-1/2 to 6 billion dollars per year. The need for greater efficiency in steel protection is reflected in the efforts of state and federal agencies, railroads, industries and associations to improve their steel protection by means of elaborate paint specifications covering every detail of a paint job.

The steel fabricating industry a few years ago under the sponsorship of the American Institute of Steel Construction established a national council for research on all phases of good painting practice. This led soon after to the organization of the Steel Structures Painting Council, which, under Dr. Joseph Sigos, Director of Research, has brought together in two volumes "Good Painting Practice" and "Systems and Specifications," a most useful store of information on paints and painting from surface preparation to the complete job. Helpful as the sections of these books on Pretreatment, Paints, Paint Systems and Paint Application are to architects and engineers in drawing up paint specifications for jobs, the emphasis given to Surface Preparation and Specifications for the methods listed has undoubtedly contributed most to an overall improvement in painting technique.

* Paper presented by Owen F. Shobe before Bridge Division, AASHTO, in Philadelphia, Penna. May 21-22, 1959.

A.I.A.S.I.C.

-3-

The American Iron and Steel Institute (Steel Facts, December, 1940) estimated from data accumulated that the average useful life of steel in 1940 was 35 years as compared to only 23 years in 1920. This period saw the greatest development of improved raw materials for paint making that have ever been placed on the market especially if you extend the period another 15 years beyond 1940. Greater stress on paint quality and having available synthetics of greater durability from which to draw in formulating, along with the gradual but steady increase in the importance attached to surface preparation must account for this increase in the life of steel in service.

Trade associations have been carrying on research programs continually in an effort to put into the hands of their customers better formulations of paints, using their products. The Lead Pigments Technical Committee of Lead Industries Association is at all times active in laboratory and field testing of special paints to improve lead pigmented paints currently recognized as the standard for painting bridge and structural steel.

The National Association of Corrosion Engineers is another group organized to study and solve corrosion problems with special emphasis on items of importance to the petroleum industry. V. B. Guthrie, "Measuring Plant Corrosion Costs," in Petroleum Processing 9 (5) 708-709, in 1954 reported corrosion to cost the petroleum refining industry 270 million dollars each year. Add to this the losses in all the other phases of the petroleum business and you have the compelling reason for NACE's corrosion research and control activities.

A.A.S.N.O.

-3-

CURRENT GOOD PRACTICE IN PAINTING BRIDGES

Let us now consider the practical aspects of present day painting of bridges and structures. A survey of the literature on painting bridges reveals the following factors to stand out as standard procedure:

1. The commonly used method of preparing bridge steel for painting is by hand or power wire brushing, chipping, scraping and sanding with removal of oil and grease deposits by solvent cleaning before hand cleaning. Certain states, especially those bordering the gulf and sea coasts, are more and more resorting to sandblasting to provide a better surface for painting on both new and repaint work. In one state, Missouri, bridges are erected unpainted, allowed to weather for removal of mill scale, and then sandblasted and painted before new corrosion develops. In still other areas where high humidity and condensation of moisture is prevalent, flame cleaning followed by wire brushing, hand dusting off and priming while still warm gives good results.

An economical method of removing grease, dust, soluble salts, dirt and much loose dead paint and other surface contaminants on maintenance painting is to do a thorough high pressure steam cleaning job before wire brushing, spot sandblasting or other specified surface preparation method is started.

2. The usual priming coat in the shop or on maintenance work in the field, unless the surface is prepared by sandblasting or pickling, is a paint having the best possible surface wetting property. It is almost an universal opinion that raw linseed oil or a vehicle with a high percentage of raw linseed oil is the only safe vehicle to use in formulating a priming paint for hand cleaned steel. The most widely used shop coat bridge steel primers are pigmented with red lead. These primers are covered by Federal Specifications TT-P-86 and TT-P-86a Type I which also meet AASNO Specifications M-72-51 Type I and II respectively.

A.A.S.H.O.

3. The first field coat after touch up on new bridges varies from a red lead tinted/shop coat primer to a red lead base primer containing a quantity amount of alkyl resin solution blended with linseed oil. In some states a field coat with about 25 per cent of other pigment, such as lead chromate or iron oxide, with the addition of some inert pigment such as magnesium silicate, is specified. In other states, a coat of gray paint, based on white lead or white lead and zinc oxide, with or without a percentage of titanium dioxide, is used as an intermediate coat for better hiding of the finish coat which may be an aluminum paint or a gray, gray green, or green alkyl or alkyl and linseed oil type of paint. It is our opinion, a tinted shop coat primer or a heavy duty intermediate coat under a finish coat is a much better system than two coats of finish over a touched up single shop priming coat. This is for the reason that about 4 mils of heavy duty primer and intermediate over a properly prepared surface will mean a minimum maintenance cost if repainting is done on a proper schedule. This will be true because of fewer thin spots to break through to bare metal on areas not given the proper film thickness of shop coat primer.

A NEW APPROACH IN PAINTING BRIDGES AND STRUCTURAL STEELSGeneral

For many years, that is, since about 1930, paint technologists have become more and more aware that certain synthetic vehicles used in making primers and finish coats for steel gave much improved performance on exposure. This reflected itself first in phenolic resin tung oil varnishes having more life on exposure and many times the water and chemical resistance of a similar varnish made from low acid rosin ester. Soon phenolic vehicle primers and finishes began to be used on trucks, buses, gas pumps and as finishes for certain structural surfaces. It was soon after discovered that the new alkyl vehicles, while lacking in water and chemical resistance as com-

A.A.S.E.O.

-5-

pared to phenolic vehicles gave much better adhesion, gloss retention on exposure, color retention and longer life on average exposure than could be obtained with any vehicles available prior to that time. Alkyd resin primers and finish coats with alkyd vehicle, used straight or blended with phenolic or other varnishes, quickly became and still are almost the standard type of finish for trucks, signs, tanks, refrigerators, automobiles, household enamels and wall surfaces.

It was only natural that, with the many known good qualities of alkyd vehicle primers and paints, they would get used prematurely on many large mill scale structural jobs and fail miserably because of poor surface wetting. This merely showed up the fact that the paint testers and formulators probably had exposed test panels with far better surface preparation before painting than was given steel in the fabricating plant when the alkyd vehicle paints started to be used in production.

For the past several months, Lead Industries Association has been making a survey of paints and painting as done by state highway departments, oil companies, public utilities and industry.

It was soon found that some highway officials, especially on repaint jobs, feel the desirability of faster dry to recoat than can be done with the usual red lead and linseed oil primer such as AISHO M72-51 TYPE II. Such a fast drying primer must also be proof against crawling on recoating under certain weather conditions and have great resistance to blistering under exposure to moisture and prevailing high humidity atmospheres, essential to avoid premature failure from rust developing in the blistered areas.

A high order of resistance to salt solutions is of great importance especially on the lower areas of bridges and hand and guard rails in states where salt is used freely in the winter to melt snow and ice.

A.A.S.H.O.

-6-

Also, longer durability of a shop coat of primer only on the steel without top coats is important.

Obviously, the essential properties listed in the preceding paragraphs can only be obtained by using primers, intermediates and finish coats formulated with synthetic vehicles. Also it is just as evident that such primers and finish coats formulated with synthetic vehicles must have some special provision for wetting the usual hand cleaned steel bridge or tank surface, or be used on steel given a more nearly perfect surface preparation.

A NEW METHOD OF SURFACE WETTING

The Lead Pigments Technical Committee of Lead Industries Association has endeavored for several years to select an additive to incorporate in a synthetic vehicle primer which would provide improved surface wetting of hand cleaned steel. The work was also undertaken by the research department of a major paint company. This work utilizes a non-volatile film forming wetting agent which increases toughness, flexibility and other necessary chemical resistance properties of the film. The work by the paint company was primarily directed toward developing a paint system for use on gasoline and other oil tanks which would be proof against blistering and subsequent rusting from humidity and moisture of condensation.

When the survey by Lead Industries Association in January, 1958, discovered the need for an improved quick drying primer, utilization of the paint company's work with which the writer of this paper had been associated, was a way Lead Industries Association could offer a method to state highway engineers for meeting the problem.

Many accelerated weathering, humidity, salt spray and surface wetting tests had already been made by private investigation which showed primer, intermediate and finish coat systems in which this wetting agent was incorporated to give results superior to anything previously known. In fact, it was the only way discovered, after many months of research, to provide a three coat tank paint system with adequate resistance to blistering from humidity and moisture of condensation.

L.I.A. PRIMERS

Obviously exterior tank painting and bridge or structural steel painting are closely related. Consequently, Lead Industries Association has prepared L.I.A. No. 2612 Quick Drying Red Lead Primer, and L.I.A. No. 2612 Quick Drying Red Lead-Basis Lead Silico-Chromate Primer, in the vehicles of which is incorporated a wetting agent, pure phenolic resin tung oil varnish, alkyd resin solution and raw tung oil. The non-volatile vehicles of these experimental primers contains the following solids by weight:

Alkyd Resin Solids	41.5 to 42.5%
Phenolic Varnish Solids	19.7 to 19.9%
Non-Volatile Wetting Agent	30.1 to 30.6%
Raw Tung Oil	7.7 to 7.8%

There is also incorporated in the total vehicle, 9 to 10 per cent ethylene glycol monoethyl ether (Cellosolve) to pick up traces of moisture on the surface when applied. Full details of these primers are covered in the attached data sheets. Thorough laboratory tests of these new primers show them to have the following physical properties compared to AISMO specification M-72-51 Types I and II:

1. Very much better wetting of loose rust, mill scale and other surface porosity.
2. Several times the resistance to humidity blistering.
3. Much improved salt spray resistance.
4. Two to three times the durability of primer only without finish coats.
5. Greatly improved intercoat adhesion of the complete paint system.
6. An 18 to 24 hour dry to take a succeeding coat under good drying conditions.
7. Controlled gloss on primer and intermediate for better recoating.

A.A.S.H.Q.

-8-

You will note from the data sheets that they use a combination of the phenolic varnish and wetting agent as phenolic resin penetrating liquid on which there is being established several sources of supply.

Laboratory tests have quite well established the superiority of red lead pigment in these primers for prevention of humidity blistering and for resistance to attack in salt spray tests.

L.I.A. No. 2628 Buff Intermediate

Good bridge painting practice would be to use L.I.A. No. 2614 Quick Drying Red Lead Primer tinted brown on the job with a bit of lampblack in oil as an intermediate coat over a touched up shop coat of the same primer.

On some jobs, it is desired to use a lighter buff intermediate coat. L.I.A. No. 2628 Buff Intermediate is intended for this application. About 20 per cent basic lead silico chromate is incorporated along with white lead and other pigments as shown on the attached data sheet to add further to protection against corrosion. Because of lower pigment volume (32.2), less phenolic resin penetrating liquid is required for surface wetting. The non-volatile vehicle in this intermediate coat is made up of the following percentages by weight:

Alkyd Resin Solids	64.0 to 69%
Phenolic Resin Varnish Solids	13.9 to 14.1%
Wetting Agent	21.5 to 21.6%

In this coat, a little over two-thirds as much of non-volatile wetting agent as is used in L.I.A. No. 2614, provides wetting of the surface porosity, be it loose rust or some unremoved chalky paint of a previous coat.

L.I.A. No. 2628 Buff Intermediate and Finish Coats have incorporated a percentage of diacetone alcohol to give "bite" into a previous coat to insure tight bonding between coats.

A.A.S.M.Q.

- 9 -

L.I.A. Finish Coats

Current finish coats for bridge painting vary from straight linseed oil vehicle paints to oil modified alkyd paints. A common practice at present is to use various combinations of raw linseed oil and oil modified alkyd resin solutions as the vehicle for finish coats. Pigmentation of many state finish coat colors can be formulated to contain a high percentage of basic lead silico chromate so as to provide rust inhibition throughout the film. Salt spray tests show an inhibitive primer film such as L.I.A. 2611 Quick Drying Red Lead followed by a second coat tinted or L.I.A. 2628 Buff Intermediate, and L.I.A. Finish Coats containing basic lead silico chromate, to have less etching of the metal than where the intermediate and finish coats over the same primer do not contain the inhibitive pigments. Such a finish coat based on a vehicle of mixed raw linseed oil and alkyd resin solution is covered by New York State specification Br M-24A - Gray Green Paint, a copy of which is enclosed.

The newly developed Lead Industries Association finish coats are based on long oil modified alkyd resin solution and phenolic resin penetrating liquid, pigmented with as much basic lead silico chromate as color permits. They are expected to show on trial bridge applications much improved salt and humidity resistance because of the much higher synthetic resin content of the vehicle. An example of a paint matching the New York Specification M-24A for color is L.I.A. 2633 - Gray Green Finish Coat, which is representative of what can be supplied matching the color standards of other states. A copy of a data sheet for L.I.A. 2633 (Experimental) is also enclosed.

These new L.I.A. Finish Coats for State Highway Department bridge paints carry less than half as much wetting agent as the L.I.A. 2611 and 2612 primers. The low pigment volume of the finish coats enable the lower content of phenolic resin penetrating liquid to provide thorough wetting of surface porosity and loose rust missed in spot priming. The non volatile portion of L.I.A. Finish Coat vehicles

A.A.S.H.O.

-10 -

is as follows:

Alkyd Resin Solids	79.0 - 80.0%
Phenolic Resin Varnish Solids	7.8 - 7.9%
Wetting additive non volatile	12.1 - 12.2%

The Bureau of Public Roads has been familiar with the development tests of the bridge paint systems covered in this paper and has suggested that the Lead Industries Association urge State Highway Departments to apply these paints to a number of new and repaint bridge jobs in as many states as possible to get experience in the field on what can be accomplished with these revolutionary new paints.

L.I.A. Primer for Galvanized Iron

Several years ago the Lead Pigments Technical Committee started a research program to find a better paint for use on galvanized iron. A drive through any area of the country reveals numerous structures with roofs or sides covered with zinc coated steel. Many of these surfaces especially on farm buildings have varying degrees of rusting plainly visible. The committee believed that a red lead base paint for use on rusty galvanized iron would surely inhibit further corrosion of the iron better than other types of paint currently used. It was also expected that a combination of pigments based on red lead as a corrosion inhibitor could be selected which would have good adhesion and durability on galvanized surfaces not exhibiting a rusty condition.

The enclosed Red Lead Technical Letter No. 13 - L.I.A. Formula 9-2, A Single Red Lead Primer for Rusted, Weathered or New Galvanized Steel, has been sent to all State Highway Departments. This primer uses 30 per cent red lead, along with non-gassing zinc dust and iron oxide as its pigmentation. After about seven years of outdoor exposure on unweathered, phosphoric acid etched and rusty galvanized iron, it is the best paint in the test. All currently recommended primers for this application are included in the test.

A.A.S.H.Q.

-11-

The Lead Pigments Technical Committee of Lead Industries Association is currently preparing a line of one-coat machinery and equipment enamels based on alkyl resin vehicle. They will use phenolic resin penetrating liquid for surface wetting so as to serve as primer and finish in one or two coats of the same material. These paints, like the bridge paints, will use basic lead silico chromate for rust inhibition insofar as color permits. They will be brought to your attention when completed.

Research on projects by the Lead Pigments Technical Committee is continuous to develop better products for your use.

Lead Industries Association greatly appreciates the opportunity to present this paper, bringing these new products for painting structural steel to your attention. We firmly believe their eventual adoption, after thorough field testing, will result in great savings to users of structural steel paints. Also, we are grateful for the help of other members of the Lead Pigments Technical Committee in helping to bring together this information to present to you.

This is a newly developed, fast drying red lead primer with good chemical resistance and excellent resistance to blistering from exposure to high humidity and moisture. The phenolic resin penetrating liquid is incorporated to give better wetting of rusty or porous surfaces than can be accomplished with a primer made with a pure linseed oil vehicle. Its controlled luster and ethylene glycol monoethyl ether component of the vehicle are designed to prevent crawling trouble in cold weather applications. It is believed that further field testing will show this product to have superior durability.

Pigment	60%
Vehicle	32%
Wt. per gal.	17.5 lb.
PV	30.5

Non Volatile by volume	70.5%
Non Volatile by weight	88.7%
Viscosity	80-90 Krebs Units
Grind (Hegeman Gauge)	4-5
Gloss	30-40

Theoretical coverage at 2 mils dry film (no loss) 569 sq. ft.
 Dry to touch - 3 to 5 hours
 Dry to recoat - 24 hours
 Reduction for Spray - 8 to 10 parts material to 1 part V.M. & P.
 Naphtha or Toluol.
 Reduction for Brush - Brush full body.

Page 2
Formula 2612

Specifications for ingredients used shall be as follows:

Raw Tung Oil: Federal Specification TT-O-395 or ASTM Standard Specification D-12-45

Mineral Spirits (Aromatic): Federal Specification TT-M-97 (2) Type II, Grade A. Boiling range 350° to 410°.

Ethylene Glycol Monomethyl Ether: Federal Specification TT-E-781 or ASTM Standard Specification D-331-35.

Driers: Federal Specification TT-D-643b or Class B of ASTM Standard Specification D-60-43.

Linseed Oil, Alkali Refined: Military Specification MIL-O-15180A.

Red Lead (97% Grade): Federal Specification TT-R-191A, Type I, Class C, or 97% grade of ASTM Standard Specification D-83-41.

Magnesium Silicate: Military Specification MIL-M-15173. (Ships) Type B.

Diatomaceous Silica: Type I of U.S. Government Maritime Administration Specification 52-MC-522 or Type I of ASTM Standard Specification D-604-62.

Aluminum Stearate: U.S. Government MIL-A-1526A.

Litharge: U.S. Government Specification JAN-L-1147.

Wax Paste: This is a paste "feeder drier" containing 44 per cent lead. Its use aids paints on long standing to retain their drying property. Its use in this paint is desirable but not obligatory. This ingredient is made by Nuodex Products Co.

Basic Lead Silico Chromate: This is a chemical combination of its constituents. Mechanical mixtures to approximate its composition are identifiable and will not be acceptable.

<u>Properties</u>	<u>Min.</u>	<u>Max.</u>
Chromium Trioxide (CrO_3)	5.10%	5.60%
Coarse Particles (325 Mesh)	-	0.20%
Ignition Loss	-	0.20%
Lead Monoxide (PbO)	46.20%	48.70%
Oil Absorption (gas. per 100 gas.)	10.00	18.00
Silicon Dioxide (SiO_2)	45.50%	48.50%

- Alkyd resin solution is TT-R-266 Type II, Class A, held strictly to the same neutrality test called for in the specification. A typical formula for an alkyd resin solution which works properly in this formula is processed as follows:

Alkyd Resin Solution

Alkali Refined Linseed Oil	2,944 lb.
Penta Erythritol	336 lb.
Glycerine	314 lb.
Phthalic Anhydride	1,290 lb.
Litharge	1-3/4 lb.
Mineral Spirits (Aromatic)	1,900 lb.

Page 3
Li-A. FORMULA 2612

Run in a covered agitator kettle with CO₂ blanket.

Run alkali refined linseed, penta erythritol and glycerine to 200° F. Add litharge and gain 450° F. Hold for monoglyceride (1-1/2 to 2 hours) until clear in denatured alcohol. Add phthalic anhydride, gain 500° F. and hold for acid number and viscosity. Off fire, cool and reduce.

Body - 2 to 21, WV 69-715, acid no. (reduced) 4; color 5 (Hellige); Wt. 7.8-8.0.

- Phenolic Resin Penetrating Liquid: This is Eastmaster Penetrating Liquid which may be purchased from The Glidden Co., Union Commerce Building, Cleveland 14, Ohio. The Glidden Co. has a patent application covering this type of wetting agent. Other suppliers of this wetting agent are being established and details may be obtained by writing to the Lead Industries Association.

Phenolic Resin Penetrating Liquid should have the following properties:

Wt. per gal.	- 7.40 to 7.44
Viscosity	- A - one bubble
Iodine No.	- 110 to 120
Saponification	- No. 135-150
Non Volatile by wt.	- 82 - 83%
Resin or Resin Derivative	- absent
Hydroxyl Value	- 1.3 to 1.5
Acid No.	- 10 to 12

Suggested Grinding Procedure:

For minimum settling of the pigment in the finished paint, add the Ethylene Glycol Monoethyl Ether only to the dry pigment in a mixer or ball mill and run the equipment for 5 to 10 minutes. Add the rest of the vehicle and grind in the usual manner to a 4, or better dispersion as shown on a Hegman Gauge.

SUGGESTED DIRECTIONS FOR USE

Surface Preparation: Remove all scaly rust and loose or peeling paint by scraping, chipping, sanding and wire brushing. Remove grease, oil or wax deposits with a thorough solvent wash. Use small amounts of solvent at a time and replenish frequently to avoid depositing a thin layer of oil or grease over the work. Hoose off soluble salt deposits with clean water. Grind or rasp off any sharp points of metal before priming.

Shop or Field Primer and Spot Primers: Apply a heavy coat of primer by brush, roller or spray to a dry film thickness of at least 2 g 1/4 mils. Reduce the primer, if heavy duty equipment is not available, with not to exceed one pint of V.M. & P. Naphtha or Toluol to the gallon of primer for spray. Allow to dry 24 hours of normal weather before applying the second prime or intermediate coat.

Page 4
L.I.A. POPPERA 2612

Where L.I.A. 2631, white or pastel shades are to be the finish coats, it is recommended that L.I.A. 2628, buff intermediate be used in lieu of a second coat of primer for more solid hiding of the white.

Field Primer or Intermediate Coat: Apply primer or L.I.A. 2628 - buff intermediate as for first primer or spot primer coat, to at least 2 $\frac{1}{4}$ mils dry film.

Tint the second coat of primer with a bit of lampblack in oil to provide a color contrast for uniform application. Dry 24 hours before recoating.

For additional information, please write to
Lead Industries Association, 60 East 42nd
Street, New York 17, N.Y.

March 2, 1959

LA-4. FORMULA 2614QUICK DRYING RED LEAD PRIMER FOR
BRIDGES, TANKS AND STRUCTURAL STEEL

This is a newly developed, fast drying red lead primer with good chemical resistance and excellent resistance to blistering from exposure to high humidity and moisture. The phenolic resin penetrating liquid is incorporated to give better wetting of rusty or porous surfaces than can be accomplished with a primer made with a pure linseed oil vehicle. Its controlled luster and Ethylene Glycol Monoethyl Ether component of the vehicle are designed to prevent crawling trouble in cold weather applications. It is believed that further field testing will show this product to have superior durability.

Reduction for Brush: - Brush full body.

Specifications for ingredients used shall be as follows:

Raw Tung Oil: Federal Specification TT-O-395 or ASTM Standard Specification D-12-4

Mineral Spirits (Aromatic): Federal Specification TT-M-97 (2) Type II, Grade A.
Boiling range 350° to 410° F.

March 2, 1959

Ethylene Glycol Monoethyl Ether: Federal Specification TT-B-781 or ASTM Standard Specification D-331-35.

Driers: Federal Specification TT-D-643b or Class B of ASTM Standard Specification D-600-43.

Linseed Oil, Alkali Refined: Military Specification MIL-O-15180A.

Red Lead (97% Grade): Federal Specification TT-B-191A, Type I, Class C, or 97% Grade of ASTM Standard Specification D-83-41.

Magnesium Silicate: Military Specification MIL-M-15173. (Ships) Type B.

Diatomaceous Silica: Type I of U.S. Government Maritime Administration Specification 52-MC-522 or Type I of ASTM Standard Specification D-604-42.

Aluminum Stearate: U.S. Government MIL-A-15206A.

Litharge: U.S. Government Specification JAN-L-1147.

Wet Paste: This is a paste "feeder drier" containing 44 per cent lead. Its use aids paints on long standing to retain their drying property. Its use in this paint is desirable but not obligatory. This ingredient is made by Wudox Products Co.

- Alkyd resin solution is TT-B-266 Type II, Class A, held strictly to the zinc neutrality test called for in the specification. A typical formula for an alkyd resin solution which works properly in this formula is processed as follows:

Alkyd Resin Solution

Alkali Refined Linseed Oil	-	2944 lb.
Penta Erythritol	-	336 lb.
Mineral Spirits (Aromatic)	-	1900 lb.
Glycerine	-	314 lb.
Phthalic Anhydride	-	1290 lb.
Litharge	-	1-3/4 lb.

Run in a covered agitator kettle with CO₂ blanket.

Run alkali refined linseed, penta erythritol and glycerine to 200° F. Add litharge and gain 450° F. Hold for monoglyceride (1-1/2 to 2 hours) until clear in denatured alcohol. Add phthalic anhydride, gain 500° F. and hold for acid number and viscosity. Off fire, cool and reduce.

Body - 2 to 2 1/2, NV 69-71%, acid no. (reduced) 4; color 5 (Hellige); Wt. 7.8 - 8.0.

- Phenolic Resin Penetrating Liquid: This is Rustmaster Penetrating Liquid which may be purchased from The Glidden Co., Union Commerce Building, Cleveland 14, Ohio. The Glidden Co. has a patent application covering this type of wetting agent. Other suppliers of this wetting agent are being established and details may be obtained by writing to the Lead Industries Association.

March 2, 1959

Phenolic Resin Penetrating Liquid should have the following properties:

Wt. per gal.	- 7.40 to 7.44
Viscosity	- 1 - one bubble
Iodine No.	- 110 to 120
Saponification	- No. 135-150
Non Volatile by wt.	- 82 - 83%
Resin or Resin derivative-	absent
Hydroxyl Value	- 1.3 to 1.5
Acid No.	- 10 to 12

Suggested Grinding Procedure:

For minimum settling of the pigment in the finished paint, add the Ethylene Glycol Monoethyl Ether only to the dry pigment in a mixer or ball mill and run the equipment for 5 to 10 minutes. Add the rest of the vehicle and grind in the usual manner to a 4 or better dispersion as shown on a Hegeman Gauge.

SUGGESTED DIRECTIONS FOR USE

Surface Preparation: Remove all scaly rust and loose or peeling paint by scraping, chipping, sanding and wire brushing. Remove grease, oil or wax deposits with a thorough solvent wash. Use small amounts of solvent at a time and replenish frequently to avoid depositing a thin layer of oil or grease over the work. Hose off soluble salt deposits with clean water. Grind or rasp off any sharp points of metal before priming.

Shop or Field Primer and Spot Primer: Apply a heavy coat of primer by brush, roller or spray to a dry film thickness of at least 2 $\frac{1}{4}$ mils. Reduce the primer, if heavy duty equipment is not available, with not to exceed one pint of V.M. & P. Naphtha or Toluol to the gallon of primer for spray. Allow to dry 24 hours of normal weather before applying the second prime or intermediate coat.

Where L.I.A. 2631, white or pastel shades are to be the finish coats, it is recommended that L.I.A. 2628, buff intermediate be used in lieu of a second coat of primer for more solid hiding of the white.

Field Primer or Intermediate Coat: Apply primer or L.I.A. 2628 - buff intermediate as for first primer coat or spot primer to at least 2 $\frac{1}{4}$ mils dry film.

Tint the second coat of primer with a bit of lampblack in oil to provide a color contrast for uniform application. Dry 24 hours before recoating.

L.I.A. FORMULA 2628FAST INTERMEDIATE COAT FOR USE ON BRIDGES, TANKS AND STRUCTURAL STEEL

This new fast drying synthetic intermediate coat has an 18 to 24 hour drying time for recoating. It has good chemical resistance and excellent resistance to blistering from exposure to high humidity and moisture.

The phenolic resin penetrating liquid content of the vehicle provides for better wetting of rust and surface porosity than can be accomplished with a similar product based on a linseed oil vehicle. Its controlled luster and strong solvent content will prevent crawling trouble in cold weather painting.

LI.A. FORMULA 2628

Specifications shall be as follows:

White Lead - Federal Specification TT-W-251a.Titanium Dioxide - Federal Specification TT-T-425a, Type III.Basic Lead Silico Chromate - This is a chemical combination of its constituents. Mechanical mixtures to approximate its composition are identifiable and will not be acceptable.

Properties	Min.	Max.
Chromium Trioxide (CrO_3)	5.10%	5.60%
Coarse Particles (325 Mesh)	-	0.20%
Ignition Loss	-	0.20%
Lead Monoxide (PbO)	46.20%	48.70%
Oil Absorption (gms. per 100 gms.)	10.00	18.00
Silicon Dioxide (SiO_2)	45.50%	48.50%

Magnesium Silicate - Military Specification MIL-M-15173 (Shipe) Type B.Platinoceous Silica: Type I of U.S. Government Maritime Administration Specification 32-MC-522 or Type I of ASTM Specification D-604-42.Mineral Spirits (Aromatic) - Federal Specification TT-M-97 (2) Type II, Grade A. Boiling range 350° to 410°.

- Alkyd resin solution is TT-R-266 Type II, Class A, held strictly to the sine neutrality test called for in the specification. A typical formula for an alkyd resin solution which works properly in this formula is processed as follows:

<u>Alkyd Resin Solution</u>	
Alkali Refined Linseed Oil	2,944 lb.
Penta Erythritol	336 lb.
Glycerine	314 lb.
Phthalic Anhydride	1,290 lb.
Litharge	1-3/4 lb.
Mineral Spirits (Aromatic)	1,900 lb.

Run in a covered agitator kettle with CO_2 blanket.

Run alkali refined linseed, penta erythritol and glycerine to 200° F. Add litharge and gain 450° F. Hold for monoglyceride (1-1/2 to 2 hours) until clear in denatured alcohol. Add phthalic anhydride, gain 500° F. and hold for acid number and viscosity. Off fire, cool and reduce.

Body - 2 to 2 1/2, HV 47-71%, acid no. (reduced) 4; color 5 (Hellige); Wt. 7.8 - 8.0.

March 16, 1939

L.I.A. FORMULA 2628

•• Phenolic Resin Penetrating Liquid: This is Rustmaster Penetrating Liquid which may be purchased from The Glidden Co., Union Commerce Building, Cleveland 11, Ohio. The Glidden Co. has a patent application covering this type of wetting agent. Other suppliers of this wetting agent are being established and details may be obtained by writing to the Lead Industries Association.

Phenolic Resin Penetrating Liquid should have the following properties:

Wt. per gal.	- 7.40 to 7.44
Viscosity	- 1 - one bubble
Iodine No.	- 110 to 120
Saponification	- No. 135-150
Non Volatile by Wt.	- 82 - 83%
Resin or Resin Derivative	- absent
Hydroxyl Value	- 1.3 to 1.5
Acid No.	- 10 to 12

Suggested Directions for Use:

Surface Preparation: Where an overall prime coat under L.I.A. 2628 Buff Intermediate Coat as in certain repaint work is not to be used, remove all scaly rust and loose or peeling paint by scraping, chipping, sanding and wire brushing, or by sandblasting where available. Remove grease, oil or wax deposits with a thorough solvent wash. Use small amounts of solvent at a time and replenish frequently to avoid depositing a thin layer of oil or grease over the work. Hose off soluble salt deposits with clean water. Grind or rasp off any sharp points of metal before spot priming with L.I.A. 2614 Quick Drying Red Lead Primer, L.I.A. 2612 Chromatized Red Lead Primer, or other suitable product.

Intermediate Coat: Apply a heavy coat of L.I.A. 2628 Buff Intermediate Coat by brush, roller or spray to a dry film thickness of at least 2 $\frac{1}{4}$ mils. Reduce the Intermediate, if necessary, with not to exceed one pint of V.M. and P. Naphtha or Toluol to the gallon of Intermediate for spray. Allow to dry 18 to 24 hours of normal weather before applying a finish coat.

L.I.A. 2628 Buff Intermediate is recommended for use where the finish coat is to be white or a pastel shade for ease in securing solid hiding of the finish coat.

For additional information, please write to
Lead Industries Association, 60 East 42nd
Street, New York 17, N.Y.

NEW YORK STATE SPECIFICATION

M-264 GRAY-GREEN PAINT

Pigment. The pigment shall be composed of:

	<u>MIN.</u>	<u>MAX.</u>
Basic Lead Silico Chromate	77.0%	
Chalk Resisting Rutile Titanium Dioxide		12.0%
Chromium Oxide Green	9.0%	
Tinting colors (Phthalocyanine Blue & lampblack), no chrome green allowed		2.0%
Organo Montmorillonite *	0.5%	

Liquid. The liquid shall consist of not less than 68% non-volatile vehicle, the balance to be combined drier and thinner. The non-volatile vehicle shall be composed of raw linseed oil and alkyl resin combined in the approximate proportions of 1 2/3:1 respectively by weight and shall contain a minimum of 8.6% phthalic anhydride. The alkyl resin, furnished as a solution, shall meet the requirements of Federal Specification TT-R-266, Type I, Class A or B. Small quantities of grinding and wetting aids may be used if desired.

The paint shall consist of:

	<u>MIN.</u>	<u>MAX.</u>
Pigment	56.5%	
Vehicle		43.5%
Weight/Gallon, lbs.	13.5	
Water		0.5%
Coarse Particles & Skins (total residue retained on 325 sieve based on paint)		1.0%
Fineness of grind (North Standard)	4	
Viscosity (Stormer - Krebs Units)	74	84

The paint shall dry in not more than eighteen hours.

* - Organo Montmorillonite - Trade Designation Bentone 38

Note: For the greatest effectiveness, the Bentone 38 should be pre-wetted with 20-30% Methyl alcohol by weight.

The percentages noted relate to mixture by weight.

L.I.A. FORMULA 2533 (EXPERIMENTAL)Gray Green Finish CoatFinish Coat for Use on Bridges, Tanks and Structural Steel

This new fast drying structural paint, because of its synthetic vehicle, has good chemical and exceptional humidity resistance. The phenolic resin penetrating liquid thoroughly saturates loose rust and porosity on any spots missed in touch-up priming. It may be applied by brush, spray or roller, and provides excellent durability on applications to a dry film thickness of 1-1/2 to 2 mils.

	<u>Composition</u>	<u>Pct Cent</u>	<u>Pounds</u>	<u>Gallons</u>

LA-1-A FORMULA 2633 (EXPERIMENTAL)

Specifications shall be as follows:

Basic Lead Silico Chromate - This is a chemical combination of its constituents. Mechanical mixtures to approximate its composition are identifiable and will not be acceptable.

Properties	Min.	Max.
Chromium Trioxide (CrO_3)	5.10%	5.60%
Coarse Particles (325 mesh)	-	0.20%
Ignition Loss	-	0.20%
Lead Monoxide (PbO)	46.20%	48.70%
Oil Absorption (gms. per 100 gms.)	10.00	18.00
Silicon Dioxide (SiO_2)	45.50%	48.50%

Titanium Dioxide - Federal Specification TT-T-425a, Type III.

Wax Paste - This is a paste "feeder drier" containing 44 per cent lead. Its use aids paints on long standing to retain their drying property. Its use in this paint is desirable but not obligatory. This ingredient is made by Woodex Products Company.

Mineral Spirits (Aromatic) - Federal Specification TT-R-97 (2) Type II, Grade A. Boiling range 350° to 410° .

Priest: Federal Specification TT-D-643b or Class B of A.S.T.M. Standard Specification D-600-43.

-
- * Alkyd resin solution is TT-R-266 Type II, Class A, held strictly to the zinc neutrality test called for in the specification. A typical formula for an alkyd resin solution which works properly in this formula is processed as follows:

<u>Alkyd Resin Solution</u>	
Alkali Refined Linseed Oil	2,944 lb.
Penta Erythritol	336 lb.
Glycerine	314 lb.

L.I.A. FORMULA 2631 (SUPERDENTAL)

** Phenolic Resin Penetrating Liquid: This is Rustmaster Penetrating Liquid which may be purchased from The Glidden Co., Union Commerce Building, Cleveland 14, Ohio. The Glidden Co. has a patent application covering this type of wetting agent. Other suppliers of this wetting agent are being established and details may be obtained by writing to the Lead Industries Association.

Phenolic Resin Penetrating Liquid should have the following properties:

Wt. per gal.	- 7.40 to 7.44
Viscosity	- 4 - one bubble
Iodine No.	- 118 to 120
Saponification No.	- 135-150
Non Volatile by Weight	- 82 - 83%
Resin or Resin Derivative	- absent
Hydroxyl Value	- 1.3 to 1.5
Acid No.	- 18 to 12

Suggested Directions for Uses:

Surface Preparation: Prime or spot prime with L.I.A. 2612, L.I.A. 2614 primers, or with L.I.A. 2629, Buff Intermediate if the finish coat is to be white or a pastel color.

Apply a heavy coat or coats of selected L.I.A. Finish Paint to a dry film thickness of at least 2 $\frac{1}{4}$ mils. by roller, brush or spray. Reduce if necessary with not more than one pint of V.M. & P. Naphtha or Toluol to the gallon of finish coat. Dry 18 to 24 hours between coats.

L.I.A. Finish Coat colors other than black, white and aluminum, may be modified by intermixing or tinting with permanent colors ground in oil.

Where L.I.A. 2615 Aluminum is to be the finish coat, apply to a dry film thickness of 1- $\frac{1}{4}$ $\frac{1}{4}$ mils, Dry 18 to 24 hours between coats.

For additional information, write to Lead Industries Association, 60 East 42nd Street, New York 17, N.Y.
