

MINING/These pellets of taconite ore, pouring from a kiln at white-hot temperatures, will be shipped to blast furnaces for the production of steel. Abex control products play a large role in the mining and processing of iron and other ores throughout the world.

Mining machines, with huge Abex dippers, pick up tons of ore in one bite and our wear control alloys take brutal punishment while crushing and grinding the ore to size. Our heat-resistant alloys are used in further processing of ore.

Abex fluid power, friction and wear control products provide power and braking for many of the machines used in mining and hauling the ore.

Extraction and processing of minerals, including petroleum, copper, phosphate rock and even diamonds utilize many Abex products. As production increases to supply a growing world population, Abex will continue to expand its facilities to meet the demand.
