those numbers are more variable, because there are variabilities in techniques used to measure asbestos fibers, so I think one has to use one laboratory's data only for that laboratory's measurements.

In other words, if one uses a figure as a cutoff, it is based on what laboratory has previously measured in different populations.

Q What were the range of fibers you would expect to find?

Are you able to give me a number like that?

A In terms of grams of wet tissue or something like that?

Q Yes.

A Again, in general, background population would be expected to have on the order of one fiber per gram of wet tissue or less. Generally less.

Q Doctor, you talked a little bit earlier about threshold and whether there is a threshold for mesothelioma, and you talked about a summer job and a time period of 10 weeks.

Previously you testified that if the
