

For The Process Industries

Vogt Heat Transfer Specialties

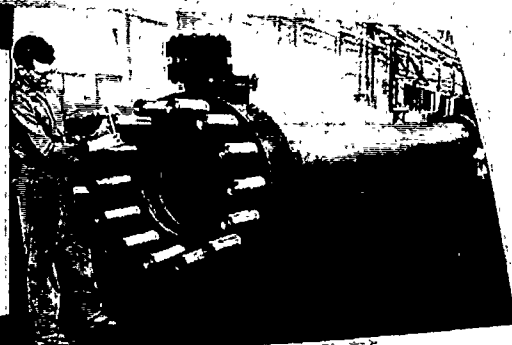

SCRAPED SURFACE EXCHANGERS are of double pipe construction. Rotating scraper elements continuously sweep the inner pipe surfaces to maintain a high rate of heat transfer between the product and the heat transfer surfaces. Outer surface of the inner pipe may be cooled or heated by liquid, vapor or evaporating fluid. Rental units are available for pilot operation.

WASTE HEAT BOILERS, incorporating the combined skills of our boiler and heat exchanger divisions, offer a wide range of designs for the recovery of heat from gases. They give efficient, low maintenance service in ammonia plants, methanol plants, petroleum refineries, petrochemical, nitric acid and sulphur plants.

HIGH PRESSURE EXCHANGERS. Vogt heat exchanger designs, for services which involve pressures up to 12,000 psi, utilize self-sealing gaskets such as double cone and delta types as well as the more conventional types.

VERTICAL FALLING FILM UREA EVAPORATORS

are filling a need in the current expansion of fertilizer production. Evaporation is accomplished with minimum contact time. These units are used primarily as first stage evaporators and are designed for vacuum or air-swept operation.
