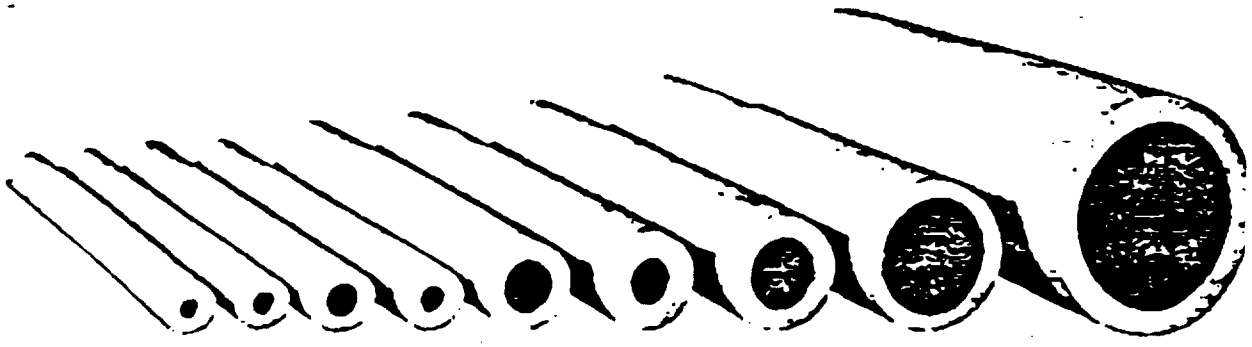
COMPOSITION [C UNIBESTOS]

UNIBESTOS is available up to 4" thickness for any size pipe or tubing from ½" tubing through 36" O.D. pipe. Pipe sizes above 36" through 44" insulation O.D. available on request.



UNIBESTOS®... the only industrial insulation made in the United States composed of unique long-fibered Amosite asbestos... is now manufactured by Pittsburgh Corning. Rugged and durable, UNIBESTOS has proved itself an ideal high temperature insulation in the marine, refining, chemical, power, and petrochemical fields.

EXCLUSIVE COMPOSITION... offers unique natural advantages

UNIBESTOS is a sectional pipe-insulation material made up of approximately 95% long-fibered Amosite asbestos, combined with an inert silicate binder and diatomaceous earth.

Amosite asbestos offers a host of unique *natural* insulation advantages which stem from:

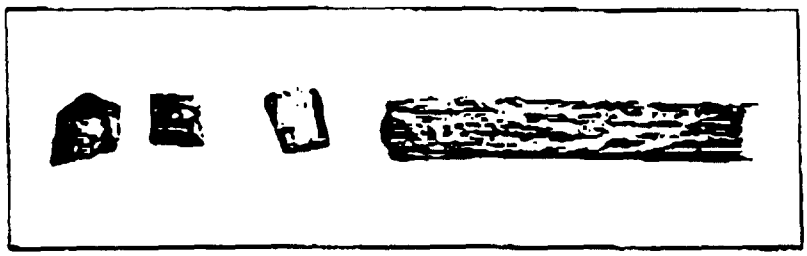
(1) Unusually long, fine, tough fibers.
(2) Inert chemical make-up.
(3) High degree of resistance to moisture.

The Amosite asbestos is processed by a special Pittsburgh Corning production technique called *fiberizing*, designed to exploit the full natural advantages of the long-fibered material. In this process, the Amosite is carefully screened, air blown, and brushed to "open up" the long, fine asbestos fibers into an interlaced fibrous mass which entraps millions of insulating air spaces. UNIBESTOS is produced by carefully forming this exclusive base material into sections of precise thicknesses, then applying a smooth, chemically-inert refractory coating.

The photographs on the opposite page graphically illustrate why UNIBESTOS is unique among insulations in its make-up and manufacture: the pages following will demonstrate that . . . *for economy, efficiency, long service and re-usability UNIBESTOS is your best buy in high temperature pipe insulation.*

The photograph below gives a vivid demonstration of the natural difference between long-fibered Amosite asbestos and ordinary asbestos. These long, thin fibers have an amazing degree of resilience. Not only does each fiber offer a high resistance to forces that tend to bend it, but groups of fibers . . . properly processed and "opened" . . . form an interlaced fibrous mass with unusual structural strength, as well as high insulating efficiency.

Amosite asbestos is found chiefly in the north central Transvaal, a province in the Union of South Africa, where uniform, graded Amosite is produced by modern facilities of the Cape Asbestos Company for export to Pittsburgh Corning plants.



This picture shows the difference between equal weights of long-fibered Amosite asbestos and an ordinary asbestos material. The pile of Amosite on the right, "opened" to almost three times the volume by the PC fiberizing process, will retain its original fluffy mass indefinitely. Ordinary asbestos, with its short, more brittle fibers, tends to pack down.

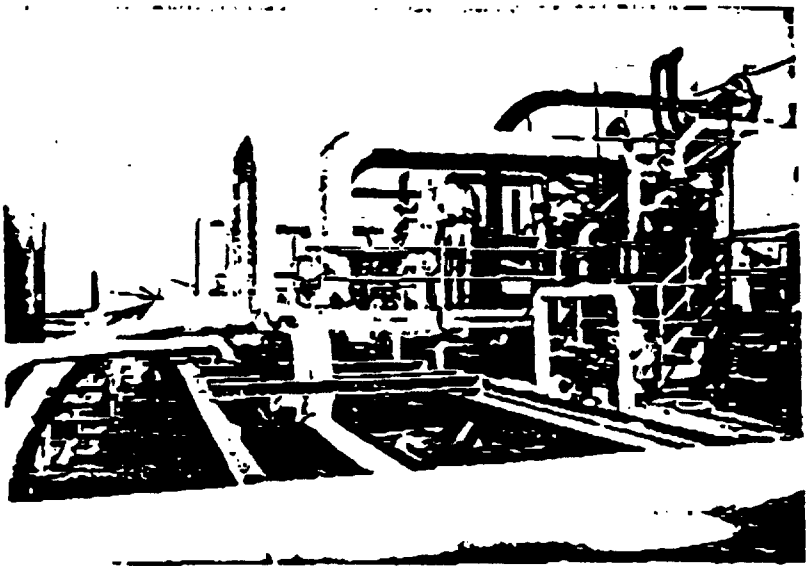
APPLICATION of UNIBESTOS

SINGLE-LAYER INSULATION . . . saves time, lowers application costs

Because of its unique combination of properties, UNIBESTOS offers many advantages in both thermal efficiency and reduced installation costs.

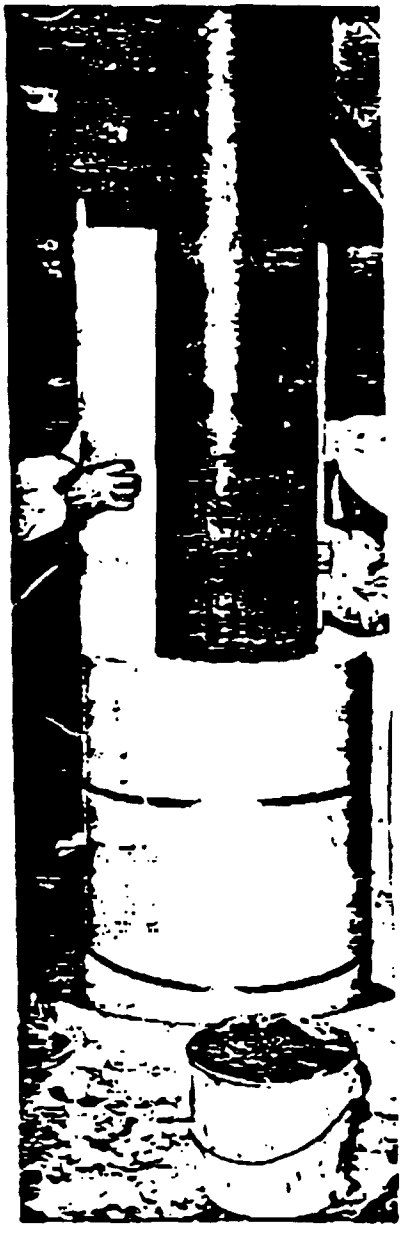
UNIBESTOS has high insulation value. UNIBESTOS is composed of Amosite, a superior grade of asbestos. One pound of Amosite will bulk to two or three times the volume of common short asbestos fibers, such as white Chrysotile or blue asbestos. The PC fiberizing process produces a mass of dead-air cells that result in low thermal conductivity. This positive thermal efficiency eliminates "guesswork" in specifying excessive safety factors, reduces over-all application costs.

UNIBESTOS needs no additional layers. With UNIBESTOS, butted joints form natural heat seals themselves. The long, tough fibers . . . which project from the butt end of sections by the thousands . . . tend to interlace when two sections are butted together. This forms a heat-tight joint and eliminates the need for additional layers required with other insulation materials. Tests show that, for equal thicknesses, a single layer of UNIBESTOS loses considerably less heat at the joint than the outside joint of a double thickness of other kinds of insulation.



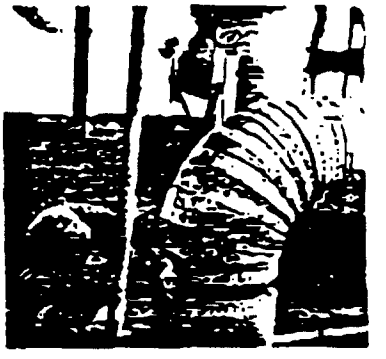
JOINT HEAT-LOSS TEST RESULTS Test Results of Surface Temperatures and Heat-Loss at Joints	UNIBESTOS Pipe Insulation (Single Layer)	"B" Insulation (Single Layer)	"B" Insulation (Double Layer)
Thickness of covering, inches	2.50	2.48	2.45
Density of covering, lbs. /cu. ft.	14.00	12.95	12.24
Energy supplied to heating coil, watts	580	650	610
Energy supplied to heating coils, Btu's /hr.	1979	2218	2081
Temperature of pipe, °F	600	600	597
Temperature of test room, °F	75	75	75
Temperature difference (pipe minus room), °F	525	525	522
Average surface temperature (not including joint), °F	114	122	116
Average joint temperature, °F	134	152	143
Average rise in temperature at joint, °F	20	30	27
Heat-loss through end caps, Btu's /hr.	244	246	244
Heat-loss through covering, Btu's /hr.	1735	1972	1837
Unit heat loss through covering, Btu's /hr. per sq. ft. of pipe surface per degree (F) of temperature difference	0.244	0.278	0.260

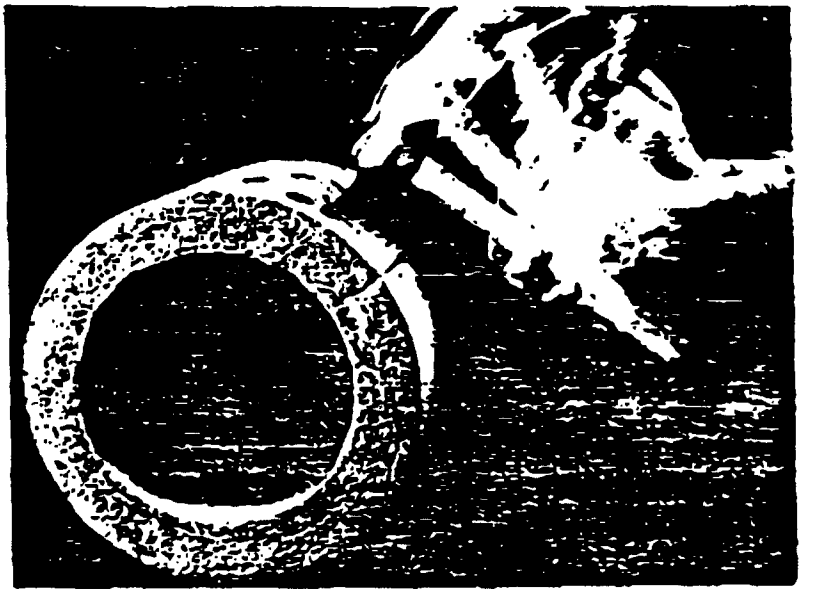
Test results from an independent laboratory.



UNIBESTOS is easy to handle, speeds installation. UNIBESTOS is a firm, *easy-to-handle* material not subject to breakage. This lowers installation, shipping, and materials handling cost. Single-layer UNIBESTOS can be installed in much less time than required for double-layer insulation. Fewer number of insulation pieces requires less space in storage and shipment. Fewer pieces must be handled in all operations, reducing labor time and costs all along the line.

UNIBESTOS is easily shaped to irregular contours. UNIBESTOS can be cut, mitered, or grooved with ordinary tools. It can be neatly adapted to bends, elbows, tees, expansion joints, flanges, valves, and other irregular shapes. Here, too, the joints form heat seals through the interlacing effect of the long fibers. And, since UNIBESTOS will not shrink at high temperatures, joints stay tight and efficient. This inherent heat sealing eliminates the need for special insulating treatment of joints and seams. Shop fabrication is simple . . . just cut UNIBESTOS to size and join with sodium silicate adhesive.





Practically no loss through breakage. ***UNIBESTOS need not be handled delicately!*** It is so rugged it will not crack or shatter on impact, even when struck with a hammer. In addition to permitting faster work, shock resistance saves money because breakage replacement costs are practically nil. It does not break in transit, thus excess quantities need not be ordered to compensate for in-transit breakage.

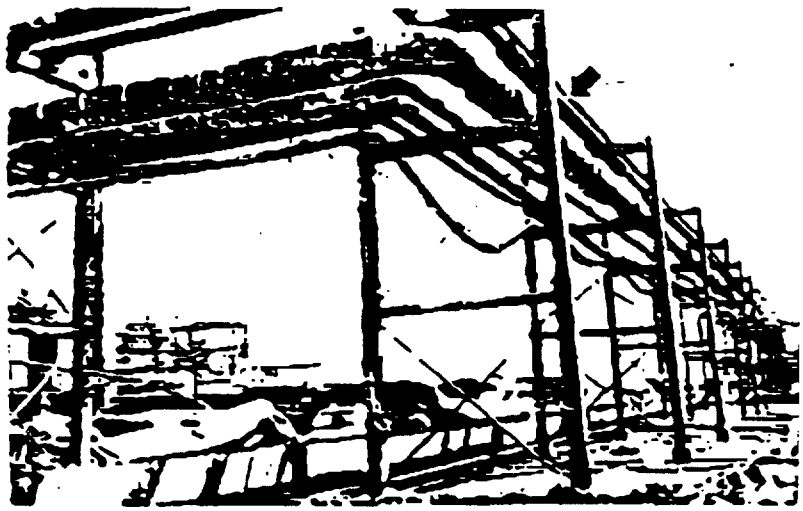
Independent laboratory tests prove superiority of *single-layer* UNIBESTOS insulation system.

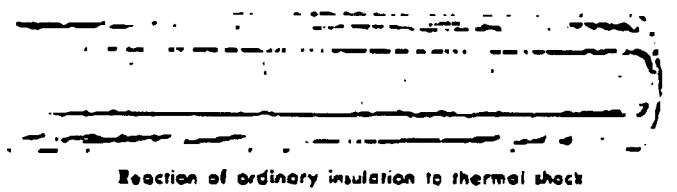
The chart illustrates results arrived at by an independent testing laboratory when testing for heat losses at insulation joints. Single-layer UNIBESTOS was tested against double-layer applications of competitive materials.

DURABILITY OF UNIBESTOS

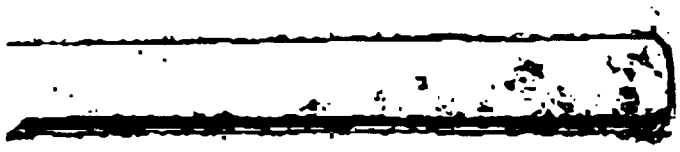
RUGGED UNIBESTOS . . . incombustible, won't shrink, no thermal shock

UNIBESTOS protects piping against costly damage from fire. UNIBESTOS is incombustible because it is a stable, inorganic iron silicate, and cannot burn. Further, its high insulation value and ability to withstand violently sudden temperature changes protect piping against excessive and rapid heat gain. Where non-insulated or poorly insulated piping buckles and melts in industrial fires. UNIBESTOS-insulated piping stays in place and is ready to function when the fire is brought under control. (See arrow in photograph of actual plant fire.)





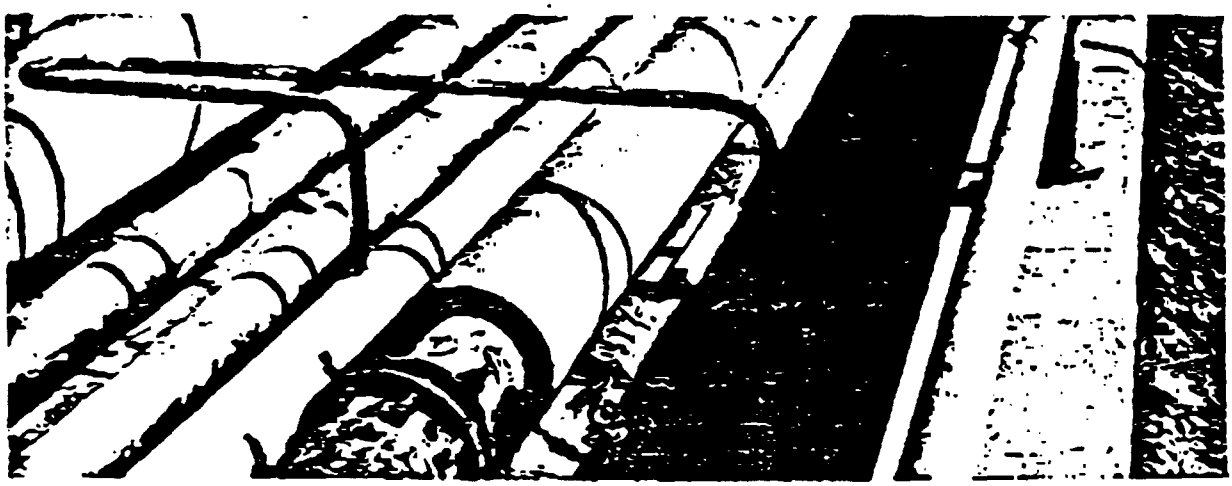
Reaction of ordinary insulation to thermal shock



UNIBESTOS sample did not crack

No thermal shock problem: Even at temperatures higher tha the 1200°F service temperatu recommended for UNIBESTO it will not thermal shock . . . r cracks or leaks will occur to in pair insulation efficiency.

UNIBESTOS has exceptional stability—won't shrink. Because UNIBESTOS is extremely heat stable . . . it does not decompose or react chemically under high temperatures. Even more important, it is dimensionally stable . . . it does not shrink! With UNIBESTOS then, section joints stay closed, and keep heat in.



UNIBESTOS resists water, moisture, acids, fumes. UNIBESTOS is chemically stable: it is not affected by water, moisture, acids, fumes or other corrosive substances. Submerged under water for weeks, UNIBESTOS dries to its original characteristics: continuous exposure to chemicals and chemical fumes does not change its insulating capacity.

UNIBESTOS for stainless steel applications. Many industrial users of UNIBESTOS have expressed satisfaction with the insulation performance of UNIBESTOS on stainless steel applications.

UNIBESTOS can be re-used. Because of its durability, UNIBESTOS can be re-used many times. Maintenance costs are reduced because new replacement insulation is not required when a line is repaired. As is shown in the illustration at right, even flange, valve and coupling coverings can be easily fabricated right on the job for later removal, when necessary.

VERSATILITY
UNIBESTOS

VERSATILE UNIBESTOS . . . high thermal efficiency in every application

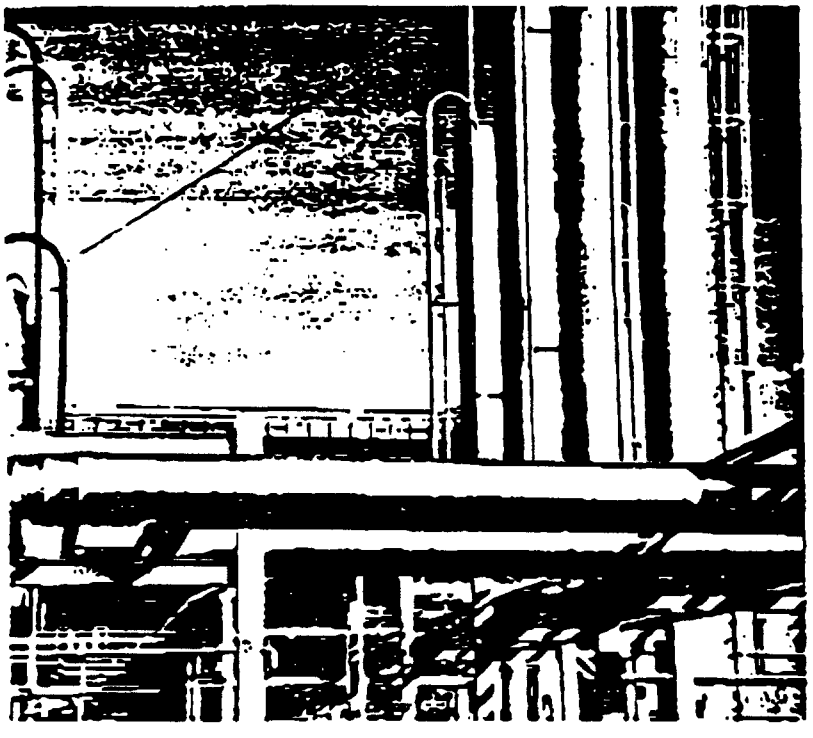
UNIBESTOS has proved itself in use in the widest range of industrial, commercial, and government installations to be the most versatile high-temperature insulation available.

■ Its high thermal efficiency means plus-profits in the form of major, long-term operational economies.

■ Its inert composition, and resistance to moisture, acids and chemical fumes assure long life in the most contaminated industrial surroundings.

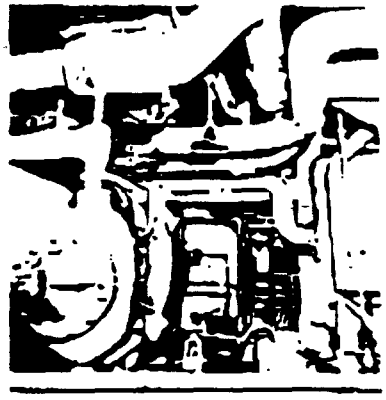
■ Its resistance to shock and abuse, and its ease of removal and reapplication not only simplifies maintenance, but cuts maintenance expenses sharply.

■ Its compact, trim, single-layer application offers the ultimate in labor-saving, without sacrifice of insulation value.

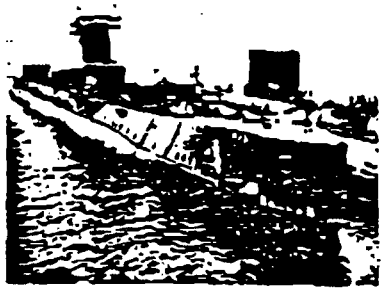


UNIBESTOS is proven best for petroleum refineries and petrochemical plants. UNIBESTOS offers superior insulation performance in corrosive atmospheres, and protects against pipe destruction in sudden and violent fires. Of particular importance is its application to heat-traced lines where its ability to conform to irregular shapes eliminate any cracking or breakage of the material. UNIBESTOS will also bridge the unsupported void between the line and tracer without breakage.

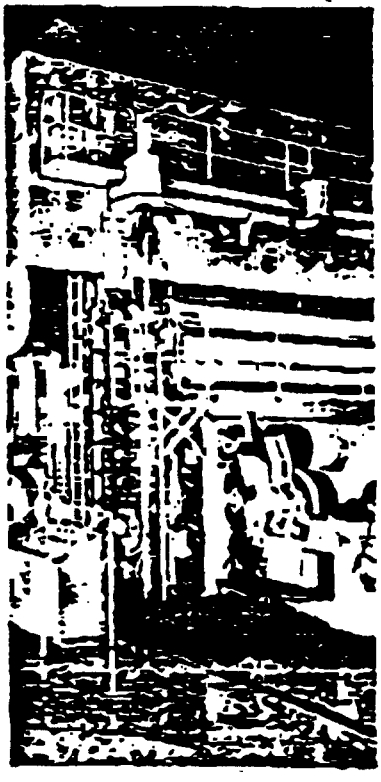
UNIBESTOS is proven best for the utility industries. For power plants with high temperature steam lines, for commercial steam heat systems, for exposed critical-temperature lines of all types, UNIBESTOS excels in insulation performance. Tough and resilient, it won't crack or thermal shock, keeping thermal efficiency high and reducing heat losses over longer piping runs.



UNIBESTOS is proven best for pulp and paper mills. In the wet, corrosive atmospheres of pulp mills and paper mills, UNIBESTOS performs at peak efficiency. Continuous exposure to chemical-laden fumes does not affect it; even after being totally submerged in water for weeks, it will quickly dry to its original characteristics.



UNIBESTOS is proven best for marine use and atomic-energy applications. The *single-layer* concept of the UNIBESTOS insulation system makes it ideal for the demanding conditions of cramped shipboard piping, particularly on atomic-powered vessels. Its fibrous structure withstands the rigors of heavy vibration which could cause granular insulations to break and crumble. The combination of unique advantages in UNIBESTOS are proving equally effective in the atomic energy field.



UNIBESTOS saves on underground lines. Because UNIBESTOS is available in full cylindrical shapes up to 44" insulation O.D., it has gained widespread acceptance as the time-saving way to insulate underground lines. Requiring less handling and no special banding, these full cylinders provide an ideal way to insulate a line for conduit application.

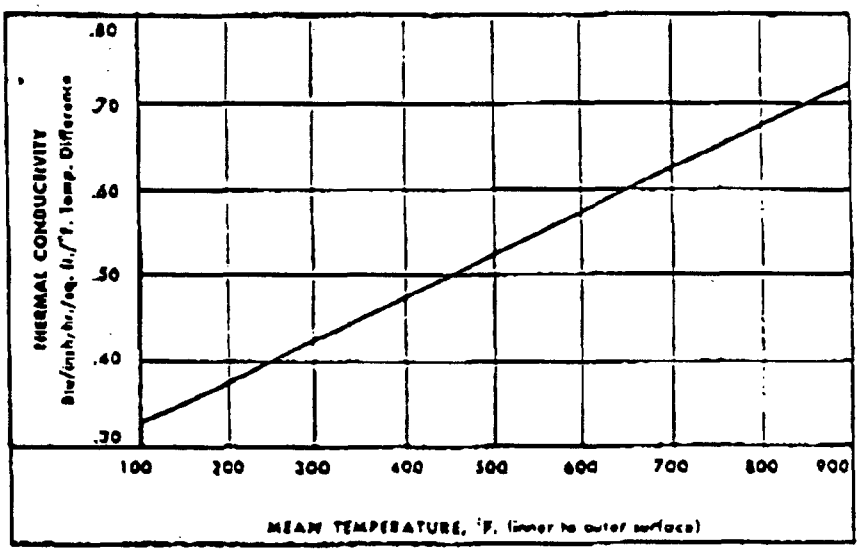
Installation is simple: the insulation is slid onto the pipe; the transverse joints are taped and insulated pipe is ready for the casing. The casing is then sealed to make a strong, efficient and economical assembly for the distribution of steam or fluids underground.

This system has become increasingly popular where heat is supplied from a central heating station. In situations like these, UNIBESTOS has supplied superior underground insulation for everything from schools, churches and colleges to hospitals, utilities and railroads as well as for processing lines for industrial plants.

SELECTIVITY
CUNIBESTOS

WIDEST SELECTIVITY... half sections or full-round sections up to 44" insulation O.D.

PHYSICAL PROPERTIES OF UNIBESTOS	
Density	16 lb.. ft.³
Compressive Strength	1600 lb./ft.² (dry; at 5% deformation)
Shrinkage	0.00% to 1200°F. (one surface) exposed to operating temperature for 24 hours
Hygroscopicity	3.5% 70°F. @ 90% R.H. 24 hours
Combustibility	Will not burn
pH	10.5
Thermal Shock	Will not thermal shock
Acid Resistance	Negligible effect on physical characteristics from common industrial acids and caustics
Noncorrosive	Will not contribute to stress corrosion of stainless steel



UNIBESTOS complies with:
Federal Specification HH-I-558c Type 4
Mil. Spec. MIL-I-2781
Grade II Class C (750°F.)
Grade III Class F (1050°F.)

Tables of suggested thicknesses. UNIBESTOS pipe insulation is manufactured in thicknesses that conform to accepted industrial and manufacturer's standards known as *simplified dimensional standards*. In order to conform to these standards, the outside diameters of all UNIBESTOS sections closely approximate those of iron pipes.

By conforming to these standards the installation of UNIBESTOS is further simplified and any dimensional confusion or adjustment is eliminated. These uniform manufacturing standards are particularly useful in the fabrication of valve and fitting covers, etc., where nesting layers of UNIBESTOS are required.

You will note that four tables of suggested thicknesses are supplied. These range from the minimum requirements (personnel protection) to the maximum thicknesses (for commercial work).

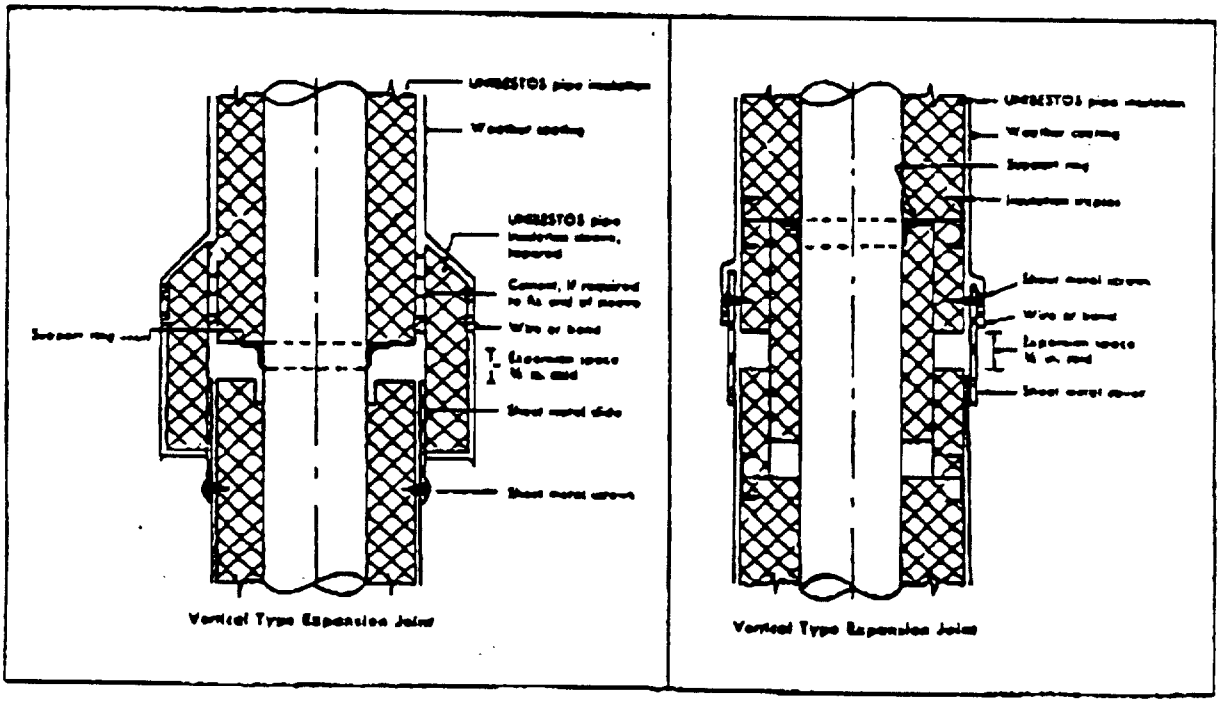
SELECTIVITY EQUIPMENT

Expansion joints and fitting covers are easy to fabricate on the job. Typical expansion joints and fitting coverings are shown on these two pages; the number and spacing of expansion joints can be determined from the table at right.

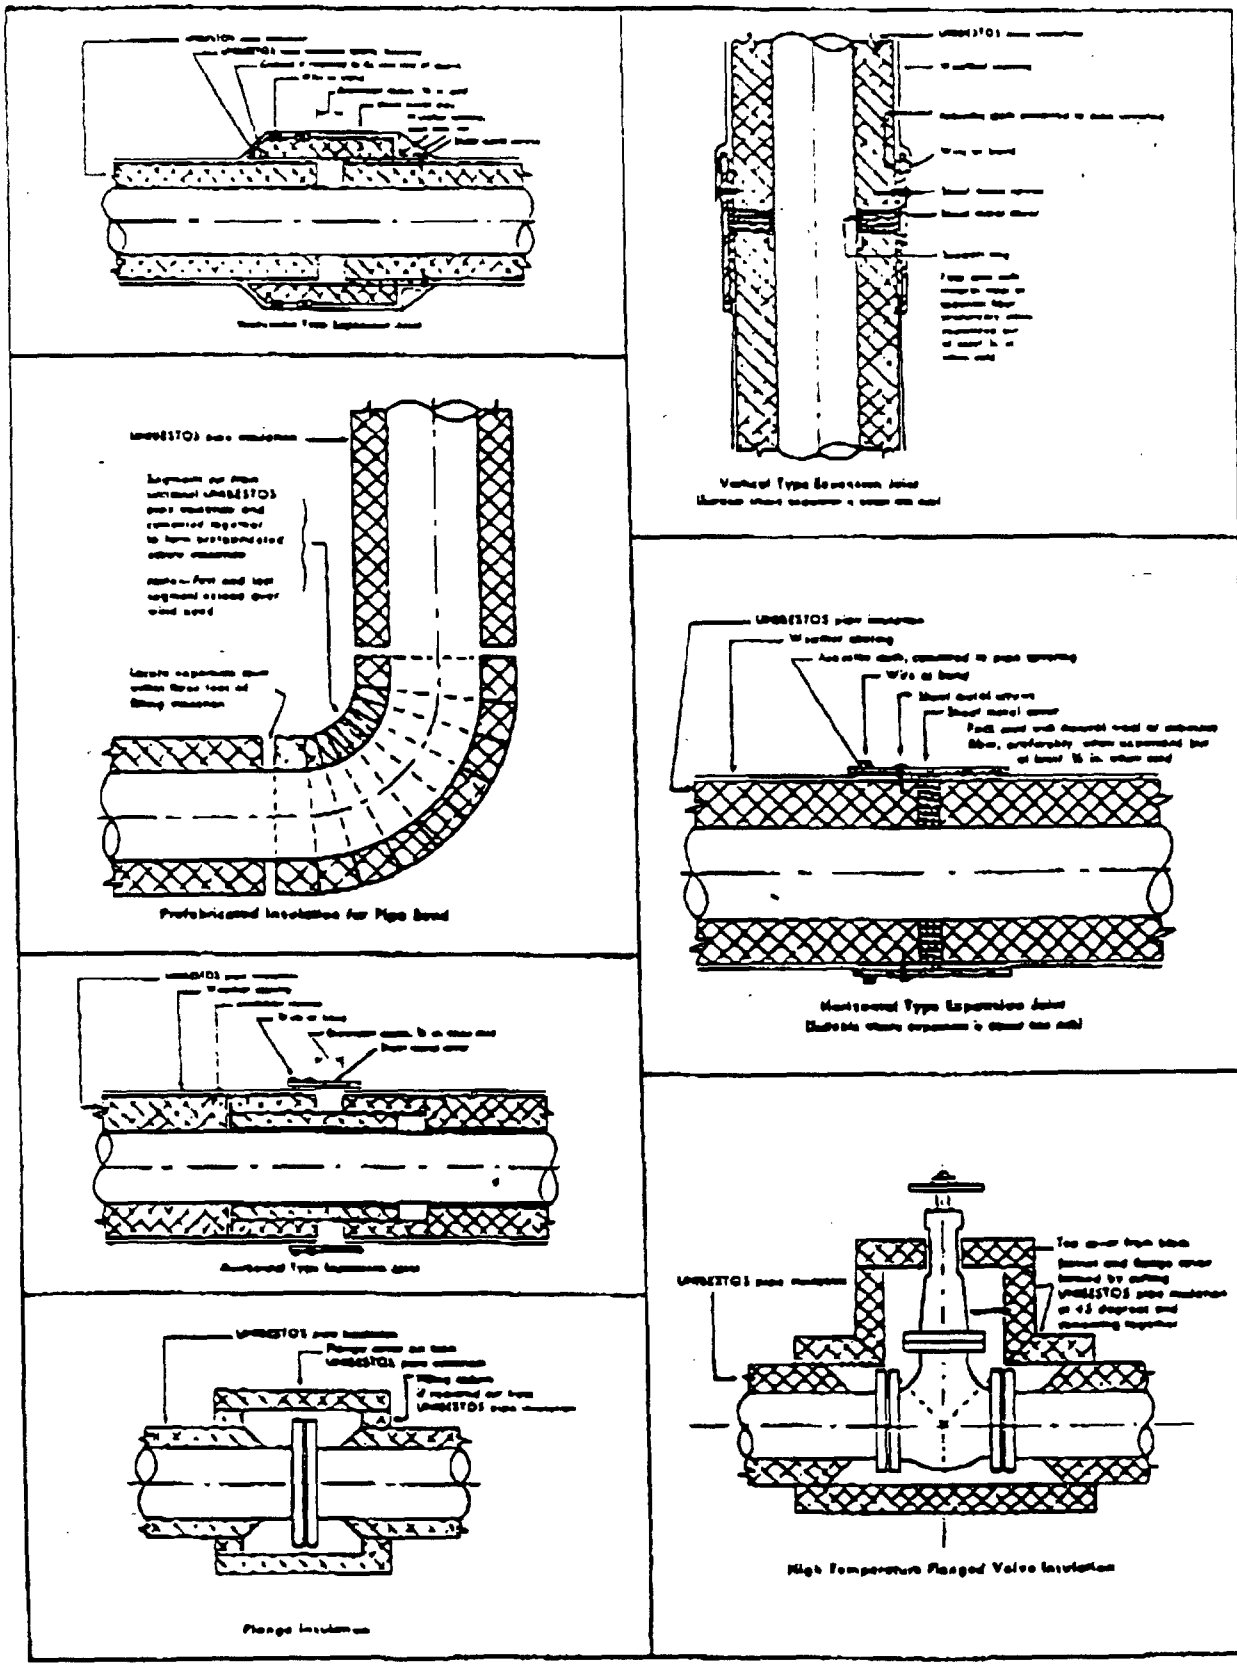
EXPANSION CONTROL

Operating Temp. F.	Linear Expansion of Pipe per 100 Ft.	Expansion Joint Spacing	Average Expansion Per Joint
1000	9.4"	12'	One Inch
950	8.8"	12'	One Inch
900	8.3"	12'	One Inch
850	7.7"	15'	One Inch
800	7.3"	15'	One Inch
750	6.7"	15'	One Inch
700	6.2"	18'	One Inch
650	5.7"	18'	One Inch
600	5.3"	18'	One Inch
550	4.7"	21'	One Inch
500	4.3"	21'	One Inch



Vertical Type Expansion Joint

Vertical Type Expansion Joint



TYPICAL SPECIFICATION FOR UNIBESTOS

1. Temperature Range. UNIBESTOS shall be used on piping operating from +100°F. to +1200°F.

2. Thickness Required. Thickness shall be determined from the table of suggested thicknesses or the most economic thickness may be calculated using the NIMA Guide for determining economic thickness.

3. Material. All piping shall be insulated with UNIBESTOS as manufactured by Pittsburgh Corning Corporation.

4. Application. UNIBESTOS shall be applied over clean, dry surfaces. Adjoining sections shall be butted firmly together using single-layer applications. Circumferential and longitudinal joints do not require pointing with finishing cement to conserve heat.

Insulation under 12" Pipe Size shall be wired in place using 16 gauge soft annealed wire; on pipe sizes over 12" use 14 gauge wire. The wiring shall be spaced no greater than 9" on centers.

Fittings, flanges and valves shall be insulated with fabricated mitered segments of UNIBESTOS equal to the thickness of the insulation of the adjoining pipe.

5. Finishes.

Indoor: On indoor lines, UNIBESTOS does not require a finish. If a finish is desired, a 6 oz. canvas shall be secured to the insulation with a lagging adhesive.

Outdoor: Outdoor piping shall be finished with a 45 lb. roofing felt lapped not less than 2". Felt jacket shall be secured with 16 gauge copper wire banded on 9" centers. Other finishes such as glass fabric and breathing-type mastic and metal jacketing may be used. Flanges, valves and fittings may be finished in the same manner as the adjacent pipe covering.

Note: The above specifications are general in nature and final specifications shall meet with the approval of the design engineer.

AVAILABLE NATIONALLY

Pittsburgh Corning provides national distribution for UNIBESTOS. More than 100 distributors stand ready to serve your insulation requirements. The PC authorized UNIBESTOS distributor is highly trained and he is well equipped to survey your job, make recommendations and estimates, and to install UNIBESTOS to meet your requirements. For your next high temperature job: select the insulation most suited to single-layer applications; select the distributor most experienced with the high temperature installations.

Call or write your nearest Pittsburgh Corning District office listed below for the name of your local authorized UNIBESTOS distributor.

Pittsburgh Corning Corporation, One Gateway Center, Pittsburgh 22, Pennsylvania—261-2900.
