

These Braiding Machines (exclusively Garlock) make a

Better Braided Packing

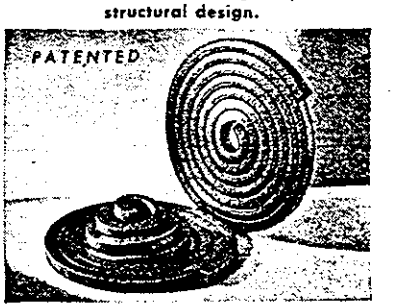

A BATTERY of specially designed machines braids strands *through and through* in an entirely new and different way in the manufacture of the exclusive patented GARLOCK *Lattice-Braid* packing.

All the braided strands are lattice-linked together into one structural unit. This unique structural design provides unusual flexibility and at the same time holds the strands together even when the packing is worn beyond the serviceable limits of wear of ordinary braided packings.

Lattice-Braid packing is manufactured of asbestos, flax or cotton for various types of service. Write for descriptive folder.

Cross section, showing unique structural design.
