June 8, 1935

Dr. W. A. Ruth  
Department of Horticulture  
University of Illinois  
Urbana, Illinois

My dear Dr. Ruth:

I have before me your letter of June first and also your earlier communication enclosing a copy of your letter to Mr. Overley of Washington State College. I have talked the matter over with Mr. Dutton and one or two other members of our staff. We think that, in general, the idea of trying to get a research project of the type outlined undertaken by an agency such as you suggest is a good one. I am a little afraid, however, that the scale on which you propose to work is hardly adequate.

Unless an experiment of this kind is conducted on a comprehensive scale and in such a way that it is more or less foolproof and criticism-proof, it won't make a dent in the situation. I think it is one of those cases where it is better either to make a killing or to do nothing at all. Instead of three people under test, there should be fifteen or twenty. Furthermore, it might be desirable to secure the cooperation of a committee representing the American Medical Association, both in planning the experiment and in judging and evaluating the results.

I realize that this will add substantially to the expense, but if all that is contemplated is just a simple test with three or four people involved, the results obtained, regardless of their nature, will not make very much of an impression on the medical world or on enforcement and regulatory agencies. I am not making these statements for the purpose of throwing any cold water on the scheme. The scheme is all right. The proposed scale, however, is entirely inadequate.

With best regards, I am

Yours very truly,

V. R. Gardner (Signed)

V. R. Gardner, Director  
of Experiment Station
