Employees or former employees at the Nitro, Krummrich, and Queeny plants who worked when there was potential for exposure to 2,3,7,8-tetrachlorodibenzo-p-dioxin or p-aminobiphenyl will begin receiving letters the week of July 27 informing them of the results of 1949 Nitro accident study. We would like to thank everyone for the work they did in putting together the correspondence together.

The report of the study has been accepted for publication and will appear in the January or March 1993 issue of Epidemiology. Please let me know if you would like a copy of this paper.
