Dear Ozzie,

I regret to advise that your recent chest shows changes very suggestive of industrial disease, probably an early stage of asbestosis, complicated by silicosis. You probably picked this up in earlier years when you were more intimately concerned with the mill. As you know I was a bit suspicious last year, but the changes were too indefinite and common to usually associate managerial staff with industrial chest disease.

No final decision has been made and you will not receive formal notice from the Honourable Minister for Mines until your condition has been further investigated. If you will be in Perth in the near future please let me know and I will arrange for you to have further x-rays, lung function and sputum tests as an out-patient, at the Perth Chest Hospital. I will not be in Perth until February 1961, but you could consult Dr. Letham at the Public Health Department - he is fully in the picture and could advise you.

There is no immediate need for concern, but naturally you should avoid further exposure to harmful dust like the plague until your chest condition has been completely investigated.

If you have any questions or need any advice, please write.

Yours sincerely,

P.S.

It will take some time to complete my review of the x-rays of your workers, but I am not too happy about the general trend.

SEVEN P.D. OFFICE
