

2. As an alternate solution to the sampling problem in explosion hazard locations, the Model UIE-175 "Uni-Jet air Sampler" fitted with a 6 ml orifice may be substituted for the battery operated pump. However, without additional calibration for use with the microimpinger, dust collection would be limited to filter operation. A one pound charge of "Freon-12" will activate the sampler for four to five hours and aspirate a five to six cubic foot sample.
