Dr. Robert A. Kehoe
University of Cincinnati
College of Medicine
Cincinnati, Ohio

My dear Dr. Kehoe:

I have been studying the literature regarding poisoning by gasoline which has been treated with tetraethyl lead. Mr. Wagner, the Los Angeles representative of the Ethyl Gasoline Corporation has referred me to you for answers to my question regarding the fundamentals and summary of the chemical reactions in the manufacture of ethyl fluid. If I am correctly informed the ethyl chloride process is the one being used and my requesting for a brief outline of the process now in use.

I would also appreciate your answers to the following questions. (1) What do you recommend at the present time for the treatment of acute and chronic tetraethyl lead poisoning? (2) Would you consider in this same class a patient who had swallowed a glass full of ethyl gasoline?

Thanking you in advance for your attention, I am
