DEPARTMENT OF RADIOLOGY

CLEVELAND, OHIO

No. 125500

Date 7/18/73

Mr. J. J. J. J. J.

Age 57

Attending Physician Dr.

Ullmann/Gomella, P.C.

Room 27 Main St., Akron

Room

OP

Hospital No.

Examination Requested

Chest

There is some mild fibrotic changes in both lungs due to some previous inflammatory disease. We also note scattered hilar and peribronchovascular calcifications from previous granulomatous infection. On the lateral view, the curve of the diaphragm is somewhat shallow and some minimal emphysema would not be excluded but I believe is best determined on clinical laboratory determinations at this time. The heart is somewhat on the small side but is otherwise normal. The costophrenic angles are clear. There is some slight wedging of one of the upper dorsal vertebral bodies to be 8-6 and probably due to some old injury in the past.

CONCLUSION: No acute or active disease in the chest. Some mild pulmonary fibrosis. ? early or mild emphysema.
