The wipe tests shown here are higher than reported by OSHA. I have questioned the 642 nanograms in terms of the area basis. No one here recalls a unit area being mentioned by OSHA. Accordingly we have no comparison basis. The lower detection limits are being determined for the wipe tests.

There are no new results on product samples. The additional product samples will require about a week or ten days. I am pushing to see if we can improve on that.

I learned from Brian Ward who took the wipe samples and followed them through analysis that Bill Papageorge and M. Throdahl will be reviewing the data with Bryan at 8:00 am tomorrow.
