Anstey Foundry uses BARONITE™ sand binder to increase casting production!

Anstey Foundry, Stevensville, Michigan, produces 20 tons of high quality gray iron castings per day in BARONITE bonded sands.

Anstey gets a lot of tough jobs, like the 600 pound laundry agitator casting illustrated here. One-package BARONITE has reduced mulling time, delivery, handling, storage and muller feeding problems by replacing four separate materials. Production has increased because of an appreciable decrease in finishing time.

Anstey finds castings poured in BARONITE sand hold their dimension and produce high quality casting detail. Excellent shakeout is attained with both green and dry sand molds.

BARONITE bonded sands produce better casting surfaces because lower moisture requirements — 3.0-3.5% — permit use of finer grain sand. Less smoke and odor are produced than with ordinary sand mixes.

BARONITE is being used successfully in foundries throughout the country. Why don't you investigate the benefits of using it in your molding sands? Contact your Baroid representative for a demonstration, or write:
