Subject AIR SAMPLES, 4th quarter 1976

A total of 13 air samples were taken for the fourth quarter of 1976.

Sample #2 was taken using a pre-weighed filter. This was done to see if you could calculate the number of fibers/cc by reweighing the filter to determine the dust weight. This should be calculated on the basis of a total air volume of 2500 cc with the dust being 10-12% asbestos, by weight.

This particular operation always seems to generate more dust than can be justified through prior air sampling results.

If you have any questions, please call.
