Henry Jongsma, Keleti's replacement in Canada, has telephoned several times in the last two weeks. He has asked about test methods in particular. However, last Friday he talked to Sam Joyce about per se properties of plasticizers.

This sounds like the type of information that your people in the Product Group have experience in getting for bulletins or other literature and passing on to salesmen and customers. Historically the Product Manager has preferred to have this kind of contact made through his Product Group. I presume you do now, so I'll pass along the gist of the last call. Then you can dispose of it as you like.

Jongsma asked about properties data which appear for each plasticizer in the "Blue Book". The plasticizers he mentioned were:

Santicizer 1100	Santicizer 1180
" 1160	" 1185
" 1165	Dioctyl azelate
" 1170	Dibutyl sebacate
" 1171	

Then he asked for per se test methods for:

Heat Stability	Solubility in Water
Pour Point	General Solubility
Surface Tension	Vapor Pressure

Tuesday of this week Jongsma called Sam to inform him that he was sending several plastisols here for Severs viscosity.

Evolution from a simple request for a copy of a test method to these last two was quite rapid. I hope we can "shift gears" easily.

J. A. Cannon
