**OSHA, NIOSH study
brain-tumor deaths at
Union Carbide facility**

Following the discovery that 10 employees at Union Carbide's Texas City, Tex. plant had died of brain tumors, the Occupational Safety and Health Administration and the National Institute of Occupational Safety and Health are conducting an epidemiological study of 8,000-10,000 present and former workers at the plant. The investigation resulted from a worker's complaint last November, alleging an abnormal incidence of brain tumors among personnel in the company's chemical-shipping area.

OSHA inspectors visited the plant on Dec. 13, 1978, and Jan. 8, 1979, and reported last week that examination of Carbide's medical records revealed 11 brain-tumor cases, including 10 deaths. Nine of the workers had died of a form of cancer called glioblastoma multiforme; the living worker is believed to have glioblastoma. The other employee died from meningioma, another type of brain tumor.

According to OSHA Administrator Eula Bingham, "The total number of brain tumors so far would appear to be higher than expected for a plant population this size." At the start of the investigation, which is expected to take about a year, vinyl chloride monomer is the leading suspect. While VCM is most commonly associated with angiosarcoma, a form of liver cancer, several studies have linked it to glioblastoma. Sanford Lellingwell, a NIOSH medical officer who is heading the epidemiological study, cites a 1976 study by Richard Waxweiler published by the New York Academy of Sciences, and a later study by Italian researcher Cesare Maltoni that showed an incidence of another type of brain tumor in rats exposed to VCM. A study supported by the NCA also recognized an incidence of glioblastoma among the workers exposed to VCM in its sample.

Carbide says that the affected workers were exposed to VCM in 1950-1965, but evidence at this point is far from conclusive. Lellingwell says that other chemicals in use at the plant, including ethylene oxide and acrylonitrile, are possible causes of brain tumors and will be examined. It is also possible, he points out, that the number of glioblastomas could turn out not to be excessive for a plant with approximately 2,000 employees. In the period since 1941, there have been 455 known deaths of Carbide employees at Texas City, although all 10 in which brain tumors were listed as the cause occurred

in the years between 1962 and 1978.

Shock Waves: Even the tentative link to VCM has sent tremors through the vinyl industry. On February 13, Union Carbide plant manager Damon L. Engle sent a letter to employees at Texas City apprising them of the brain-cancer cases. A similar letter was given to employees at Carbide's S. Charleston, W.Va., facility, and other VCM manufacturers were informed of the findings at Carbide. A Dow Chemical statement cautions against hasty correlation of the deaths with VCM. Dow says that mortality studies conducted recently at Freeport, Tex., and last year at its Plaquemine, La., VCM facilities failed "to show any indication of a similar situation. Both studies showed no deaths from brain tumors among VCM workers."

The joint OSHA-NIOSH investigation team is gathering data. As a result of findings to date, OSHA is also investigating a "compliance complaint" at Monsanto's operations in Texas City and says that it is possible that other plants will also be checked, though none has been identified.

Davis Layne, area director of OSHA's Houston office says "We are just beginning to turn the leaves, and it all depends on what turns up."

**Stauffer's board OK's
2-for-1 stock split**

Stauffer Chemical's board last week approved a two-for-one stock-split proposal that they will present to shareholders on April 18 for final approval. The move is the latest in a string of stock-split proposals by such chemical companies as Du Pont, Mobil Corp., SmithKline, and Carlsle Corp., (CW, Feb. 14, p. 10).

H. Barclay Morley, Stauffer's chairman, said the proposed split would help bring the stock price, which was around \$40/share last week, down to a level that would be more attractive and affordable to investors.

The proposal calls for boosting Stauffer's authorization for shares to 70 million from the present 30 million. Right now there are about 21.9 million shares outstanding, and the largest shareholder among the board of directors, Christian de Dampierre, owns fewer than 2%.

The board also said that, if the shareholders approve the proposal, the board will consider boosting the second-quarter dividend by 10%, to 27.5¢/share after the split. The move would be in line with the company's policy of raising dividends to offset the effects of inflation. Stauffer has split its stock two for one twice in the past—in April 1957 and in May, 1976. □

**Syntex nears naproxen
lawsuit settlements**

Pharmaceutical producer Syntex Corp. agreed last week to settle out of court pending lawsuits with Syntex shareholders and Industrial Bio-Test Laboratories (IBT) connected with IBT's alleged deficiencies in testing Syntex's anti-inflammatory drug, naproxen.

The agreement calls for Syntex to set up a \$2.7 million fund, of which \$1.8 million will go to IBT, \$575,000 to shareholders. In exchange, the lawsuits would be dropped. The arrangement is still subject to approval.

The settlement fund benefits action lawsuit plaintiffs, whose suits in 1976 and later consolidated in court in New York, alleged that IBT was deficient in performing and reporting a rat study of Syntex's Naprosyn drug. The suits also charged that Syntex or should have known about the deficiencies, and that the price of Syntex's securities were artificially inflated because of allegedly fraudulent representations and omissions stemming from the company's statements on naproxen. In addition, on Oct. 15, 1978, the Food and Drug Administration posed withdrawal of its approval of naproxen's new drug application on the basis of the alleged deficiencies in the tests by IBT for Syntex.

Syntex says it is working on the settlement to avoid a lengthy and costly trial, which would require four scientists and executives to waste months in courtrooms thousands of miles away. "Our company admits no wrongdoing in case, and, in earlier answers to the denied all allegations of improper conduct. As of July 31, 1978, Syntex's worldwide sales of naproxen were \$10 million. The fiscal year 1978 saw a record of inflammatory drug marketed in 15 countries, is a major product in 15 human pharmaceutical businesses.

Nalco Chemical Corp.'s parent company, notes that, as part of the settlement, Syntex agreed to buy back a portion of the maker filed against IBT in Chicago. The settlement of the suits in New York approved. And, under the \$1.8 million payment under the settlement terms, 2 says, will be used to fund the cost for discontinued operations set up by Nalco in 1978.

Syntex, meanwhile, says it will fund the study of naproxen in question submitted it to FDA in late 1978. It has far had no response from FDA.
