issues its regulations that you talked about this morning, they really concentrate on the fibers per cc number; isn't that right?

A For OSHA that is correct.

Q Okay. So with respect to OSHA then, they are concerned about the 2.2 fibers per cc; and I guess the .77 under area sampling; the .3 fibers per cc; the 8.5 fibers per cc; and the 1.7 fibers per cc?

A Generally, unless there has been some TEM data done, sometimes they consider that as well.

Q I think you indicated this morning that they did not have a lot of TEM data upon which to draw experience, and that was one reason that they continued to use the fibers per cc?

A They use the light data to make most determinations, although there are some situations where they have used the TEM data as well.

In their Salt Lake City office where they have the laboratory, they sometimes get involved in projects where in order to make a determination in certain industry, they will look at the TEM data as
