SUBJECT Aroclors - 3 Generation Rat Reproduction and Fish Toxicity

TO : R.E. Kelly, M.D./E.P. Wheeler

A visit to Industrial Bio-Test Laboratories, Inc., April 28, 1970 revealed the following progress to date of this study:

Testes
The first litters of F₂A were OK for 1242. However, the females for F₂B (second time around) failed to become pregnant at the 100 ppm level. The other two levels were OK. Only 1 female (100 ppm level) had pups which are now 12 days old. As a matter of fact only 2 or 3 of the 16 females are pregnant and they haven't delivered as yet. It is planned to remate these females for 1 week to see what will develop.

Regarding the fish toxicity studies (catfish and bluegills) the time scheduled will be 2 to 3 weeks behind because doses which were believed to be OK produced 100% kill.

At levels of 1 to 10 ppm for both 1242 and 1254, for 50 fish per level, all died.

For 1260 at levels of 10 and 100 ppm there were a few survivors at 10 but all were dead at 100 ppm.

1254 - The F₀ 2nd litter at 100 ppm had poor survival and pre-mating increasing a bit. The survival from the 3rd mating was low but sufficient to fill the groups. The F₁ are now mating to produce F₂A. The 10 and 1 ppm levels are OK.

[Signature]

1260 - There are no problems at the 1, 10, and 100 ppm levels. The F₁ are mating to produce the F₂B litters.
