Q Which is a different standard than the million particles per cubic foot?

A Yes, I am trying to relate it to past exposures. This is on the average.

Doesn't mean there aren't periods where there are higher exposures and lower exposures.

You have to realize, it is also an average for not any one worker, but for the whole trade.

As we said, some of which worked with nonasbestos materials for significant portion of their work. And so it is not for a worker, not an average for a worker who goes on a job today, works with asbestos all day long. It is not his average.

It is over a whole working lifetime among that population.

Q That is why Balzer and Cooper went out to several jobsites and tried to get a real good feel for what type of work was being done and what different products were being used.

They didn't just go out and take a snapshot here and there, they worked closely with the unions to
