Mr. Tom Roman,
c/o Ethyl Cooperation,
Tulsa, Oklahoma.

Dear Mr. Roman:

I would like to bother you to the extent of obtaining about one dram of the tetra-ethyl lead as used in the various ethyl and anti-knock gasolines. My reason for asking for this is as follows: I would like to use it for skin tests on people that have contact dermatitis that work with ethyl gasoline.

I have a case in mind at the present time, a man from Nebraska, that has a low-grade contact dermatitis that is definitely associated with his work, and we find that on patch testing him with the gasoline that contains the tetra-ethyl lead, it produces a blistering of the skin that is not produced with the other gasoline. I am unable to produce this same blister by using other lead preparations. If it is at all possible for you to send me a small amount of this material for testing, I would appreciate it greatly.

There is no question of compensation involved in the case I am concerned with.

Thanking you very kindly, I am

Very truly yours,

Geo. J. Seibold
