Re: Disposal of Sediment from Cleaning
of Tanks Containing Leaded Stocks

Dear Van:

In response to your letter of March 4 on the subject indicated above, I can make little further contribution to our thinking of the past several years. It seems apparent to me that sludge can be disposed of in a variety of ways under suitable circumstances - i.e. buried, dumped at sea, dumped into swamps or other similar waste places that are unlikely to be entered or made use of without suitable precautions, (such as our ravine at Baton Rouge, Du Pont's swamp at Deepwater).

When the quantities are small the problem is relatively easy. Then perhaps chemical treatment could be used. The residue from the large tanks is the serious problem, and I fail to see what can be done, other than what is being done about these cases, except at very considerable expense. It is all very well to suggest "chemical treatment, combustion and dilution" but how?

I'm willing to hear suggestions from any source, but I have nothing to offer as a substitute for what is now being done. Whoever may wish to try something else should be encouraged and cooperated with.

Sincerely yours,

Robert A. Kehoe, M. D.

Dear Dr. Kehoe:

Subject: Disposal of Sediment from
Cleaning of Tanks Containing
Leaded Stocks

The attached letter was submitted to Mr. Bob Black of Esso Standard Oil Company by the Safety Supervisor of Esso Standard Oil's Baltimore refinery.

We would very much appreciate your views on the handling of sludge from tanks that had contained leaded gasoline before answering their inquiry.

With kindest regards,

Sincerely yours,

L. R. Fleck

Disposal of Sediment from
Cleaning of Tanks Containing
Leaded Stocks

Memo to:

Mr. E. C. Sommer
Safety Division

In a recent Staff Meeting a question arose concerning the desirability of continuing the practice of disposing of sediment from the cleaning of tanks which contained leaded stocks by burying in a hole dug in surrounding impounding area. In view of the report that the lead compounds in the sediment do not disperse over indefinite periods of time, it was suggested that:

- (1) the question of dispersal of lead compounds in sediment buried under the earth be developed; and
- (2) if the report is correct, investigate other methods for disposing of the sediments to render them harmless.
These might be:

- (a) Chemical treatment
- (b) Combustion
- (c) Dilution
- (d) Other

Please advise us as promptly as possible of the results of your investigation and of any recommendations in connection with the problem.
