when he passed through his retirement at the end of age 64, so that we have losses in 1993 when Mr. Grewe was 56. He lives in a portion of 1993, and he dies in 1993.

So we look at the years 1994, 1995, 1996, 1997, 1998, 1999, 2000, and 2001.

So if he were alive, he would have been 57 in 1994, 58 in 1995, 59 in 1996, and his age would have continued to increase, and he would have retired at the end of his 64th year.

If we look at -- we will start with 1994 and go back to 1993.

If we look at his average income for the two to three previous years that Mr. Grewe had lived or that he had worked, he averaged about $38,634 a year.

So that each of these amounts he would have been able to earn throughout up until his retirement.

The same amount for the year '93, but we just divide that into two parts, a part prior to death, which is 32,195, and a part after death which is $6,439.
